## 1. Introduction

The aim of this book is to introduce $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ to a non-technical person. $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ is excellent for producing professional looking documents, however it is a language not a word processor, so it can take a bit of getting used to, particularly if you have never had any experience using programming languages.

EATEX does take a while to learn, so why should you use it? Here are a few reasons but it is not an exhaustive list:

LETEX is far better at typesetting mathematical equations than word processors. I wrote my Ph.D. thesis back in the days of EPTEX2.09 (the old version of LATEX) and given the high quantity of mathematics that I had to typeset, it would have taken me considerably longer to write it in a word processor, and the resulting document wouldn't have looked nearly as good. Even Microsoft have acknowledged TEX's high-quality mathematical typography [12].
[FAQ: Why is TeX not a WYSIWYG system?]

## 1 Introduction

## Example:

Here's an equation taken from some kernel survival analysis:

$$
\frac{\partial^{2} \mathscr{L}}{\partial z_{i}^{\rho 2}}=-\frac{\partial \rho_{i}}{\partial z_{i}^{\rho}}\left(\frac{\partial v_{i}}{\partial \rho_{i}} \frac{\mathrm{e}^{v_{i}}}{1-\mathrm{e}^{v_{i}}}+v_{i} \frac{\mathrm{e}^{v_{i}} \frac{\partial v_{i}}{\partial \rho_{i}}\left(1-\mathrm{e}^{v_{i}}\right)+\mathrm{e}^{2 v_{i}} \frac{\partial v_{i}}{\partial \rho_{i}}}{\left(1-\mathrm{e}^{v_{i}}\right)^{2}}\right)
$$

(You can find out how to create this equation on page 350 in Section 9.4.9.)
That's all very well and good if you want to typeset some equations, but if your work doesn't involve maths, does that mean that $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ is not for you? Although I am a mathematician, I have written plenty of documents with no maths in at all, including prose, poetry, newsletters, posters and brochures, but I still opt for $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ because using $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ ensures consistent formatting, and the style of the document can be completely changed by simply using a different class file, or loading additional packages. This means that I can concentrate on writing the document, rather than worrying about how it will look. It also means that if, after having written a 200 page document, I then find that I need to change all the figure captions so that they are labelled "Fig" instead of "Figure", all I need to do is edit a

## 1 Introduction

single line, rather than going through 200 pages to individually edit every single figure caption. ${ }^{1.1}$

Serious fiction writers are taught never to remind the reader that they're reading a book. Poor formatting is just as much a reminder of this as authorial intrusion.

LTEX makes it very easy to cross-reference chapters, sections, equations, figures, tables etc, and it also makes it very easy to generate a table of contents, list of figures, list of tables, index, glossary ${ }^{1.2}$ and bibliography. You don't need to worry about numbering anything, as this is done automatically, which means that you can insert new sections or swap sections around without having to worry about updating all the section numbering etc. Furthermore, if you use BibTEX ${ }^{1.3}$ in combination with $\mathrm{ET}_{E} \mathrm{X}$, and you have, say, 100 or more citations, it doesn't matter if you are then told that the citations have to be re-ordered (say, in order of citation rather than alphabetically). All that is required is a minor edit to change the appropriate style file rather than ploughing through the entire document changing all the citations by hand.

[^0]
## 1 Introduction

When you are editing a document using a word processor, the word processor has to work out how to reformat the document every time you type something. If you have a large document with a great many inserted objects (such as figures and equations), the response to keyboard input can become very slow. You may find that after typing a few words you will have to wait until the computer catches up before you can see what you have typed. With EATEX you type in your code using an ordinary text editor. The document doesn't get formatted until you pass it to ${ }^{E} T_{E} \mathrm{X}$, which means that you are not slowed down by constant reformatting.

Lastly, there's the fact that $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ follows certain typographical rules, so you can leave most of the typesetting to $\mathrm{ET} \mathrm{T}_{\mathrm{E}} \mathrm{X}$. You rarely need to worry about minor things such as inter-sentence spacing. The default is English spacing, but if you have a publisher who disapproves of this, you can switch if off with a single command. (See Section 2.13.)

LATEX will also automatically deal with f-ligatures. ${ }^{1.4}$ That is, if any of the following combination of letters are found: $f 1, f f 1, f f, f i, f f i$, they will automatically be converted into the corresponding ligatures: fl, ffl, ff, fi, ffi. Note the difference between fluffier (2 ligatures) and fluffier (no ligatures). These points may seem minor but they all contribute towards the impact of the entire document. When writing technical documents, the presentation as well as the content is important. All too often examiners or referees are

[^1]
## 1 Introduction

put off reading a document because it is badly formatted. This provokes an immediate negative reaction and provides little desire to look favourably upon your work.

To give you an idea of what you can do with ETEX, this book was written in ${ }^{2} T_{E} X .1 .5$ The PDF versions (including the paperback version) were generated using PDFLATEX and makeindex and the HTML version was generated using the ETEX2HTML ${ }^{1.6}$ converter.

For more reasons as to why you might want to use ${ }^{1} \mathrm{AT}_{\mathrm{E}} \mathrm{X}$ instead of a word processor, have a look at Why TeX?

### 1.1 Class and Package Documentation

There are hundreds of classes and packages available on the Comprehensive $T_{E} X$ Archive Network ${ }^{1.7}$ (CTAN). These are made available by many volunteers. Some provide detailed documentation to accompany their contribution, while others only provide a few notes in a README file or comments in the source files. This book only provides an introductory look at

[^2][FAQ: Conversion from (La)TeX to HTML]

## 1 Introduction

a small selection of these contributions. If you want further details on how to use a particular class or package you should check the documentation that accompanies it. You can use the texdoc application to search for the documentation. This is a command line application, which means you need a terminal or command prompt (see Section 2.5).

To use texdoc, you need to type (at the command prompt) texdoc followed by a space followed by the name of the class or package you want information about. For example, to read the memoir documentation, type the following at the command prompt (press the return/enter key $\longleftarrow$ at the end of the line):
texdoc memoir
Some packages come with more than one set of documentation. For example, the glossaries package comes with the main user manual, a short guide for beginners and the documented code for advanced users. Just doing
texdoc glossaries
will display the advanced documented code. To list all available documentation for a package, use the -1 option:
texdoc -l glossaries

## 1 Introduction

Then type the number corresponding to the file you want to view. If you can remember the file name (for example glossaries-user) you can type that next time you want to view it:
texdoc glossaries-user
There is also a Perl/Tk-based graphical user interface (GUI) called texdoctk, which is distributed with TeX Live, that you can use instead of texdoc if you can't work out how to use a terminal or prefer a GUI approach.

Failing that, you can also check on CTAN [1] using the URL ctan.org/ $\mathrm{pkg} /\langle$ name $\rangle$, where $\langle$ name $\rangle$ is the name of the package or class. For example, if you want to look up the documentation for the memoir package, you can find it at http://ctan.org/pkg/memoir or go to http://mirror. ctan.org/ and search for the package or class.

Another alternative recently made available is to use the URL texdoc.net/ $\mathrm{pkg} /\langle$ name $\rangle$. For example, http://texdoc.net/pkg/memoir will fetch the documentation for the memoir class.

However, it's better to use texdoc or texdoctk to read the documentation installed with the class or package on your computer to ensure it matches the installed class or package version.

Note that it is important to remember that the $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ world is mostly supported by volunteers. CTAN [1] itself is maintained by a very small group (currently two people). It's not like a commercial company with 24/7
support and hundreds of paid employees constantly updating the software. At its core, $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ is a community effort. While some volunteers actively maintain and update their classes or packages, some people move on to other things and stop maintaining their work. Occasionally, if the class or package is popular, someone else might take over maintenance. There is no dedicated helpdesk to go to, but there are many ways of getting help, see Appendix C (Need More Help?)

### 1.2 Overview

This document is structured as follows:
Chapter 2 (Some Definitions) defines terms that will be used throughout this document. I strongly suggest that you look through this chapter before you start so that you understand the terminology used in this document. At the very least, you should read the first part that details how corresponding input and output is displayed in this document - you need to understand the difference between "input" (source code) and "output" (how the source code will appear in the typeset document).

Chapter 3 (From Source Code to Typeset Output) details the software that you will need to use $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ and describes how to use the software.

Chapter 4 (Creating a Simple Document) shows you how to create a very basic document.

Chapter 5 (Structuring Your Document) shows you how to create chapters and other sectional units so that you end up with a fully structured document.

Chapter 6 (The graphicx Package) shows you how to include external image files and how to scale and rotate text.

Chapter 7 (Floats) describes how to create figures and tables.
Chapter 8 (Defining Commands) describes how to define your own commands, and redefine existing commands.

Chapter 9 (Mathematics) describes how to typeset mathematics.
Chapter 10 (Defining Environments) describes how to define new environments.

Chapter II (Counters) discusses how numbers are stored in counters, how to change their values, and how to define your own counter.

Appendix A (Downloading and Installing Packages) shows you how to download and install additional packages that weren't installed with your $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ distribution.

Appendix B (Common Errors) documents possible errors you may encounter, and gives advice on how to fix them.

Appendix C (Need More Help?) gives pointers on where to go for help.
Throughout this document there are pointers to related topics in the UK List of $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ Frequently Asked Questions ${ }^{1.8}$ (UK FAQ). These are displayed in the margin in square brackets, as illustrated on the right. You may find these resources useful in answering related questions that are not covered
[FAO: What is LaTeX?] in this book.

This book and associated files, including solutions to the exercises, are available on-line at: http://www.dickimaw-books.com/latex/novices/. The links in this document are colour-coded: internal links are blue, external links are magenta.

[^3]
### 1.3 Recommended Reading

This document is designed as an introductory text, not a comprehensive guide. For further reading try some of the following:
${ }^{E T} T_{E} X:$ A Document Preparation System [9] is the user guide and reference manual for LATEX, and is a good basic text for anyone starting out, however it doesn't cover AMSTEX, so anyone who needs to typeset more than basic mathematics may prefer either A Guide to $E T_{E}^{X}[7]$ or The $E A T_{E}^{X}$ Companion [3]. Both these books cover AMSTEX, BibTEX and makeindex.

In the same series as The ${ }_{E A} T_{E} X$ Companion, there is also The ${ }_{E T} T_{E} X$ Graphics Companion [5] which details how to illustrate documents with LATEX and PostScript, including a chapter on colour (coloured text, background, tables and slides). This is recommended to anyone who is contemplating heavy use of graphics, but you do need a basic knowledge of LATEX before delving into it.

The final book in the "Companion" series which you may find useful is The $E A T_{E} X$ Web Companion [4]. This is recommended for those interested in creating documents for the web, either as HTML or PDF. It details how to convert $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ documents into HTML using various applications such as LaTeX2HTML and TeX4ht, and how to create PDF documents using PDFETEX, including how to create active links within your document using the hyperref
[FAQ: Books on LaTeX]
[FAQ: What are
the AMS
packages?]
[FAQ: What is
PDFTeX?] package.

## 1 Introduction

There are two new $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ books that I haven't read but have been recommended to me: $E T_{E} X$ Beginner's Guide [8] and $E T_{E} X$ and Friends [19].

Note that the UK TEX User Group ${ }^{1.9}$ (UK TUG) has a $25 \%$ book discount scheme for members. See http://uk.tug.org/membership for more details of that and other associated benefits. If you're not in the UK, have a look at http://www.tug.org/usergroups.html to see if there is a local user group in your area.

There is also a wealth of LATEX-related information on the Internet. CTAN [1] is a good place to start. You can check the on-line catalogue [21]
[FAQ: How to get help] for information about available software and, as mentioned earlier, there is also the list of frequently asked questions which I recommend you try if you have any queries. See also Appendix C (Need More Help?)

[^4]
## 2. Some Definitions

As mentioned in Chapter 1 (Introduction), $\mathrm{ET} \mathrm{E}_{\mathrm{E}} \mathrm{X}$ is a language, so you can't simply start typing and expect to see your document appear before your very eyes. You need to know a few things before you can get started, so it's best to define a few terms first. Don't worry if there seems a lot to take in, there will be some practical examples later, which should hopefully make things a little clearer.

Throughout this book, source code is illustrated in a typewriter font with the word lnput placed in the margin, and the corresponding output (how it will appear in the PDF document) is typeset with the word output in the margin.

## Example:

A single line of code is displayed like this:
This is an \textbf\{example\}.
The corresponding output is illustrated like this:
This is an example.
[FAQ: Why is TeX not a WYSIWYG

## 2 Some Definitions

Segments of code that are longer than one line are bounded above and below, illustrated as follows:

Line one $\backslash$ par
Line two par
Line three.
$\qquad$
with corresponding output:

Line one
Line two
Line three.

Take care not to confuse a backslash \with a forward slash / as they have different meanings. (Commands typeset in blue, such as \par, indicate a hyperlink to the command definition in the summary.)

Command definitions are shown in a typewriter font in the form:

In this case the command being defined is called \documentclass and text typed $\langle$ like this（such as $\langle$ options〉 and $\langle$ class file $\rangle$ ）indicates the type of thing you need to substitute．（Don＇t type the angle brackets！）For exam－ ple，if you want the scrartcl class file you would substitute $\langle$ class file〉 with scrartcl and if you want the letterpaper option you would substitute〈options〉 with letterpaper，like this：
\documentclass［letterpaper］\｛scrartcl\}
But more on that later．
Sometimes it can be easy to miss a space character when you＇re reading this kind of book．When it＇s important to indicate a space，the visible space $s_{s y m b o l}^{\llcorner }$is used．For example：
$A_{\lrcorner}$sentence ${ }_{\lrcorner}$consisting ${ }_{\lrcorner} f_{\lrcorner}$six $x_{\llcorner }$words．
When you type up the code，replace any occurrence of $\lrcorner$ with a space．
One other thing to mention is the comment character \％（the percent symbol）．Anything from the percent symbol up to，and including，the end of line character is ignored by $\mathrm{ETT}_{\mathrm{E}} \mathrm{X}$ ．Thus

```
A simple % next comes a command to make some bold text
\textbf{example}
```

will produce the output
A simple example
The percent symbol is often used to suppress unwanted space resulting from line breaks ${ }^{2.1}$ in the source code. For example, the following code

| Foo\% | § Input |
| :--- | :--- |
| Bar | $\pm$ Input |

will produce the output:
FooBar
as opposed to
${ }^{2.1}$ ETEX treats the end-of-line character as a space.

2 Some Definitions
Foo
Bar
which will produce the output:
Foo Bar
On the other hand, spaces at the start of a line of input are ignored, so

| Foo\% | § Input |
| :--- | :--- |
| Bar | $\downarrow$ Input |
| still produces: |  |
| FooBar | Output |

### 2.1 Source Code

The source code consists of all the text and $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ commands that make up an entire document. The source code is typed in using a text editor, and saved with the file extension .tex. The source code may be contained in just one file, or it might be split across several files.

### 2.2 Output File

The ${ }^{E} T_{E} \mathrm{X}$ application reads in your source code and creates the typeset document, the output file. This book assumes that you will be using the version of $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ that produces PDF files (PDFETEX). If you are using TeXWorks (see Chapter 3 (From Source Code to Typeset Output)), you need to select the "PDFLaTeX" item from the drop-down list. If you are using TeXnicCenter, select the "LaTeX $\Rightarrow \mathrm{PDF}$ " build profile. If you are using WinEdt, when you want to build your document click on the button marked "PDFLaTeX" rather than the one marked "LaTeX". If you are using a terminal or command prompt, use the command pdflatex rather than latex. (TeXnicCenter, WinEdt and using the terminal or command prompt approach are described in the supplemental material. $)^{2.2}$

### 2.3 DVI File

TEX (and subsequently LTEX) originally created DVI (DeVice Independent) files instead of PDF files. ${ }^{2.3}$ However, although there are free DVI viewers, not many people have them installed, so it's really only $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ users who can

[^5]read them. Also, you can't embed image files in a DVI file or have fancy effects, such as rotation. Instead, people can use $\mathrm{T}_{\mathrm{E}} \mathrm{X} / \mathrm{ET} \mathrm{T}$ t to create a DVI file and then use an application to convert the DVI file to PostScript.

These days PDF is the preferred platform-independent format, and with the advent of PDFTEX, modern TEX/ETEX users can directly create PDF documents rather than going through the DVI route. Some people still prefer to create DVI files as an intermediate step, particularly if they want to embed PostScript instructions (as is done by the pstricks package). For simplicity, this book assumes that you have a modern $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ distribution and are using PDFEATEX rather than EAT $_{E} X \Rightarrow$ DVI.

### 2.4 Auxiliary Files

When ETTEX creates your output file, it not only creates a PDF file but also creates other associated files. The most common of these are the log file, which has the extension .log, and the auxiliary file, which has the extension .aux.

The log file contains a transcript of the most recent ETEX run. It lists all the files that have been loaded, including the class file and any packages that your document has used. There should also be the class or package version number and date, although this is dependent on the class or package author. If you ever want to ask for help, you need to say what version

## 2 Some Definitions

you are using.
For example, this book uses the scrbook class, so the log file includes the lines:
(/usr/local/texlive/2010/texmf-dist/tex/latex/koma-script/ scrbook.cls
Document Class: scrbook 2010/06/17 v3.06 KOMA-Script document class (book)
(This is actually now out-of-date as the latest version at the time of writing this is version 3.11a dated 2012/07/05.)

Error messages, warnings and general information messages are also written to the log file as well as the document statistics. You can delete this log file if you like. It will be created again the next time you run $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$.

The auxiliary file contains all the information needed for cross-referencing (covered in Section 5.5). This is needed to ensure all your cross-references are up-to-date. You can delete this file, but you will need at least two $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ runs to ensure your cross-references are correct the next time you create your output file.

TeXWorks also creates a file with the extension .synctex.gz. This file allows you to jump to and from the source code and the appropriate part of the output file. If you delete this file, you will have to run $\mathrm{ET}_{\mathrm{EX}} \mathrm{X}$ again before you can use this function.

## 2 Some Definitions

Other files that may be created include the table of contents file (.toc), the list of figures file (.lof) and the list of tables file (.lot). Some class files or packages create additional files. If your operating system hides file extensions, you might want to switch off this behaviour, if possible, to make it easier to distinguish between all the various files.

TeXWorks has a menu item File $\rightarrow$ Remove AUX Files that will remove the auxiliary files.

### 2.5 Terminal or Command Prompt

Sometimes you may find that you need to use a command-line application. This is an application that doesn't have a graphical user interface. This isn't specific to $\mathrm{T}_{\mathrm{E}} \mathrm{X}$, but the $\mathrm{T}_{\mathrm{E}}$ distribution comes with a number of them. In fact, front-ends (such as TeXWorks) run some of these applications for you when click on the typeset or build button.

Most operating systems provide a terminal or command prompt where you can type the command-line application name and any associated information. For example, Figure 2.1 shows a terminal running under Fedora on Linux.

Windows To open the MSDOS Prompt, go to the Start menu, then "All Programs", then "Accessories" and click on "MSDOS Prompt".

Mac OSX To open the Mac Terminal, go to your "Applications" folder, open "Utilities" and double click on "Terminal".

Unix etc The Terminal is usually located either in the "Applications" menu or in the "System Tools" subdirectory of the "Applications" menu.

## Example:

One such command-line application you are likely to need is texdoc. This is mentioned in more detail in Section 1.1, but to use texdoc you need to open the terminal or command prompt as described above and type texdoc followed by a package or class name, for example:
texdoc scrbook
(see Figure 2.2) then press the Enter or Return $\longleftarrow$ key.
Other $\mathrm{T}_{\mathrm{E}} \mathrm{X}$-related command-line applications include pdflatex, bibtex, makeindex, xindy and kpsewhich.

### 2.6 Commands

A command is used to tell $\operatorname{ET}_{E} \mathrm{X}$ to do a particular thing at that point in the document. These are the basic forms a command can take:

## 2 Some Definitions

Figure 2.1 A Terminal

2 Some Definitions

Figure 2.2 Running texdoc From a Terminal

## 1. A Control Word.

This is a backslash $\backslash$ followed by letters ( $\mathrm{A}, \ldots, \mathrm{Z}, \mathrm{a}, \ldots, \mathrm{z}$ ). There can be no non-alphabetical characters in the command, apart from the initial backslash, and the name is always case-sensitive so, for example, $\backslash$ gamma and $\backslash$ Gamma have different meanings. One command that often trips up new users is $\backslash$ LaTeX, which prints the LaTeX logo: LTEX. This command has three captial letters and two lower case letters. If you get the case of any of the letters incorrect, you will get an "undefined control sequence" error.
There must be no space between the backslash and the start of
[FAQ: Commands gobble following space]
the command name. Some command names are made up of two or more names joined together, such as \tableofcontents. Make sure you don't insert any spaces in the control word. This will either lead to an error or an unexpected result. For example,
\appendixname
displays "Appendix" but
$\backslash$ appendix name
switches to the appendices and then prints the word "name".
Most ${ }^{E A T} T_{E} \mathrm{X}$ commands have fairly self-explanatory names. (For example, \chapter starts a new chapter and \rightarrow prints an arrow pointing to the right.) However, in most cases, you need to use U.S. spelling (for example, \color rather than \colour).
This is the most common form of command. Any spaces immediately following a command of this type are ignored, so for example
\TeX nician
will produce
TEXnician
whereas
\TeX\{\} nician
will produce
TEX nician

But the following will cause an "undefined control sequence" error:

There is one command that you must use in every document you create, and that is the \documentclass command. This command must be placed at the very start of your document, and indicates what type of document you are creating. This command is described in more detail in Chapter 4 (Creating a Simple Document).

## 2. A Starred Command

Some commands have variants that are indicated by an asterisk at the end of the name. For example, \chapter makes a numbered chapter whereas \chapter* is makes an unnumbered chapter. A starred command is the version of the command with the asterisk. (On a UK keyboard the asterisk character is usually located on the same key as the digit 8.)
This may seem like a different form to a control word, described above. After all, I've just said that a control word can only contain alphabetical characters. However a starred command is actually a control word (such as \chapter) followed by an asterisk. The control word checks to see if the next character is an asterisk. If it is, it performs one action, otherwise it performs another action.

This type should therefore just come under the previous category, but as you will often hear of "starred commands" it seemed better to have a separate category.

## 3. A Control Symbol.

This is a backslash followed by a single non-alphabetical character. For example $\backslash \%$ will print a percent symbol. Spaces are not ignored after this type of command, for example
17.5<br>% VAT
will produce

> 17.5\% VAT

It's also possible to have starred forms of control symbols. For example $\backslash \backslash$ forces a line break. If it's not followed by an asterisk a page break is allowed at that line break, but if it is followed by an asterisk $\backslash \backslash *$ no page break is allowed at that line break. (If a page break is needed, it will be made at the end of the previous line instead.)

## 4. Character Sequence.

Some special sequences of characters combine to form an instruction. For example ffi is the command to produce the ffi ligature, and the sequence of symbols ! ' is the command to produce the upside down exclamation mark i

## 5. An Internal Command.

This is like the first type, a control word, but the @ character appears in the command name (for example ternalcommandsshouldonlybeusedinclassfilesorpackages.The@symboltakesonaspecialmeaningwhenafileisincludedusing\documentclass(aclassfile)or\usepackage(apackage).Forexample,inaclassfileorpackage\c@sectionisaninternalrepresentationofthesectioncounter,whereasina.texfile\c@sectionisinterpretedasthecommand\c(thecedillaaccentcommand)thattakesthecharacter@asitsargument,followedbysection,whichproducestheratheroddlooking@section.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

Don't be tempted to use internal commands until you have first grasped the basics. You have been warned!
[FAQ: \@ and @
in macro names]

### 2.7 Grouping (or Scope)

A segment of code may be grouped by placing it within \{ and \} (curly braces). Most commands that occur within a group will be local to that group. For example, $\backslash \mathrm{bfseries}$ changes the font weight to bold, so the following segment of code:

```
Here is some text. {This text \bfseries is in a group.} Here is
```

some more text.
will appear in the typeset document looking like:
Here is some text. This text is in a group. Here is some more text.
As can be seen, the font change only stays in effect until it reaches the end of the group (signified by the closing curly brace \}.) For a command to be in the same scope as another command, both commands must be within the same group. For example, in the following, \bfseries and \itshape are in the same scope:

But below, they are in different scopes:

2 Some Definitions
$\{\backslash$ bfseries Some bold text $\}$ \{\itshape and some italic text $\}$
Environments form an implicit scope.

### 2.8 Arguments (also called "Parameters")

Some commands take one or more arguments. This provides a way to give ${ }^{E} T_{E} \mathrm{X}$ additional information so that it is able to carry out the command. There are two types of arguments: mandatory and optional.

### 2.8.1 Mandatory Arguments

Mandatory (or compulsory) arguments are arguments that have to be specified.

## Examples:

1. If you want a footnote, you need to use the $\backslash$ footnote command, which has a mandatory argument that specifies the contents of the footnote. Like this:

Here is a footnote. $\backslash$ footnote\{This is the footnote text.\}

Here is a footnote. ${ }^{2.4}$
(By default you won't get a hyperlink. This book uses the hyperref package, which generates the hyperlinks.)
2. If you want to start a new chapter, you need to use the \chapter command, but you also need to tell ETEX the title of this new chapter. So the \chapter command takes one mandatory argument that specifies the title.

For example, the following code:
\chapter\{Some Definitions\}
was used to generate the heading for the current chapter (at the top of page 13).
3. The command \textbf typesets its argument in a bold font (as opposed to the declaration $\backslash$ bfseries which switches to a bold font.)
For example, the following code:
\textbf\{Some bold text.\}

[^6]2 Some Definitions
produces the output

## Some bold text.

## Notes:

1. ETEX takes the first non-space object following the command name as the argument, which is why in the above examples the arguments have to be grouped.

Suppose the last example above didn't have a group, so instead the code was:
\textbf Some bold text.
then only the " S " would be the argument because it's the first object following the command, in which case the output would look like:

Some bold text.

## 2 Some Definitions

2. If you want the argument to be blank, use empty braces: \{\}. For example, suppose you want to have a chapter without a title ${ }^{2.5}$ you would need to do:
```
\chapter{} Input
```

### 2.8.2 Optional Arguments

Some commands may have one or more optional arguments. Unlike mandatory arguments, optional arguments must always be enclosed in square brackets [ ].

## Example:

The command $\backslash \backslash$ ends a line. So the following segment of code:
Line one<br>Line two.
will produce the following output:
${ }^{2.5}$ The numbers for chapters, sections etc are automatically inserted by $\operatorname{IAT}_{E} \mathrm{X}$, so this example would produce a numbered chapter without a title.

## 2 Some Definitions

| Line one | 〒 output |
| :--- | :--- |
| Line two. | $\downarrow$ Output |

However the $\backslash \backslash$ command also has an optional argument that allows you to specify how big the gap between the two lines should be. So the following segment of code:

Line one $\backslash \backslash[1 \mathrm{~cm}]$ Line two.
will produce the following output:

Line two.
$\qquad$
Incidentally, note the difference between the previous example, and the following example:

Line one $\backslash \backslash\{[1 \mathrm{~cm}]\}$ Line two.

## 2 Some Definitions

| Line one | 〒 output |
| :--- | :--- |
| $[1 \mathrm{~cm}]$ Line two. | $\downarrow$ output |

In this example the [1cm] has been placed inside a group, so it is no longer considered to be an optional argument, and since the command $\backslash \backslash$ does not take a mandatory argument, the $[1 \mathrm{~cm}]$ is simply interpreted as ordinary text.

## Example:

The command \framebox (which will be covered later in Section 4.7.1) takes a mandatory argument and two optional arguments. \framebox puts a frame around the contents of its mandatory argument:
$\backslash f r a m e b o x\{S o m e ~ T e x t\}$
Some Text
The first optional argument can be used to make the box a specified width:
$\backslash$ framebox[4cm] \{Some Text\}
Some Text
[FAQ: Start of line goes awry]

Input

Output

The second optional argument specifies the justification of the text (left, right or centred) within the box:

```
\framebox[4cm][r]{Some Text}
```

## Some Text

In general, if a command has both optional and mandatory arguments, the optional arguments are usually specified first (although there are a few exceptions).

### 2.9 Moving Arguments and Fragile Commands

Certain types of commands, called fragile commands, can seriously mess things up when they are used in what is termed a moving argument. These types of argument are generally those whose contents are copied to another part of the document. For example, section headings appear at the start of a section, but they can also appear in the table of contents. The $\backslash$ footnote command is a fragile command, so

\section\{A heading $\backslash$ footnote\{with a footnote\}\}

## 2 Some Definitions

will cause an error.
If there is no other command to use in its place, you should use $\backslash$ protect
[FAQ: An extra
immediately before the fragile command:
$\backslash$ section\{A heading $\backslash$ protect $\backslash$ footnote\{with a footnote\}\}
This, however, is a contrived example, because it isn't a good idea to have a footnote in a section heading, as it will also end up in the table of contents, and possibly in page headings.

### 2.10 Robust Commands

A robust command is a command that is not a fragile command.

### 2.11 Short and Long Commands

A short command is a command whose argument may not contain a paragraph break (either as a blank line or using $\backslash$ par.) Conversely, a long command is a command whose argument may contain a paragraph break.

Using short commands helps to test for forgotten braces, so it is recommended that when you define a new command (see Chapter 8 (Defining

Commands)) you should always make the command a short command, unless there is a chance that the argument may need to contain a paragraph break.

### 2.12 Declarations

The term declaration is used to refer to a command that affects the document from that point onwards. The declaration itself does not produce any text and, in most cases, its effect can be localised by placing the declaration
 current font weight to bold, so the following code

| Here is some normal text. |
| :--- |
| $\backslash$ bfseries Here is some bold text. |
| will appear in the typeset document looking like: |
| Here is some normal text. Here is some bold text. |
| $\quad$Some declarations don't immediately have a visible effect. For example, |
| the declarations |

## 2 Some Definitions

\raggedright \raggedleft only set the paragraph justification to ragged-right, ragged-left or centred, respectively, if the declaration is still in effect at the end of the paragraph. That is, if it is still in effect at the next $\backslash$ par or blank line.

## Example:

This is an example paragraph illustrating the paragraph justification declarations. The default justification is fully justified. \raggedright The paragraph justification can be switched to ragged-right or $\backslash$ raggedleft ragged-left. \par

This is an example paragraph illustrating the paragraph justification declarations. The default justification is fully justified. The paragraph justification can be switched to ragged-right or ragged-left.

Above, the justification at the paragraph break is ragged-left, so that's the justification used for the entire paragraph. Compare with:
\{This is an example paragraph illustrating the paragraph justification declarations. The default justification is fully justified. \raggedright The paragraph justification can be switched to ragged-right or $\backslash$ raggedleft ragged-left.\} $\backslash$ par

This is an example paragraph illustrating the paragraph justification declarations. The default justification is fully justified. The paragraph justification can be switched to ragged-right or ragged-left.

Above, the justification at the paragraph break is fully-justified, since both the declarations \raggedright and \raggedleft are cancelled when their local scope (signified by the curly braces) ends. This type of mistake most often occurs when people try to centre text doing something like:

```
{\centering Some text that is supposed to
be centred.
}
```

Next paragraph.

The paragraph break (blank line) must go before the closing brace.
$\{\backslash c e n t e r i n g$ Some text that is supposed to be centred.
\}
Next paragraph.
While we're on the subject of centred text, don't be tempted to use \centerline. It's obsolete [15].

### 2.13 Inter-Sentence Spacing

Inter-sentence spacing refers to the default type of space to be inserted between adjacent sentences within a paragraph. There is disagreement over what size this space should be. French spacing uses the same space as used between words. English spacing uses an en-space (half an emspace). With proportional fonts (such as this one), the en-space is slightly larger than a single space. The difference is shown here:

2 Some Definitions

$\mathrm{X} \backslash$ enspace X
$\qquad$

(Note that with fully-justified paragraphs, in both cases the spaces may be stretched to ensure the sides of the paragraph are flushed.)
$\mathrm{T}_{\mathrm{E}} \mathrm{X}$ (and $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ ) defaults to English spacing, but you can switch to French spacing using the declaration:
$\backslash$ frenchspacing
and switch back again using
$\backslash$ nonfrenchspacing

## 2 Some Definitions

There was no en-space on a typewriter, so typists started using two spaces in an attempt to emulate that slightly larger than one space look. This habit has spread to word-processor users as well, and now many people incorrectly assume English spacing means adding two spaces after a full stop, which is too wide and looks ugly, but this error shouldn't be used as a criticism against English spacing.

There has been a gradual trend towards French spacing over the last century, and some publishers insist on it. I think this may in part be due to a backlash against the ugliness of two spaces in typewritten and wordprocessed documents. In fact the Oxford Style Manual [11] simply states, "In text, only use a single space after all sentence punctuation."

Personally, I prefer English spacing, particularly in reference books. I have many reference books on my shelf, but I haven't read any of them from cover-to-cover. I flick to a particular section and skim through the paragraphs until I reach the desired bit of information. Sometimes I've already looked something up, so I have a vague idea as to where to find the information. The extra space between sentences makes it easier to locate a particular sentence.

This isn't so much of an issue with books designed to be read from beginning to end, such as a novel. However, I have read one such book that used a font where the commas had tiny tails and most of the sentences contained multiple proper nouns, which made it very difficult to read as it

## 2 Some Definitions

wasn't clear where the sentences ended. Is that a full stop followed by a new sentence that happens to start with a proper noun, or is it a comma whose tiny tail is blurred by my short-sighted eyes followed by a clause that happens to start with a proper noun? A well-written, well-presented document should not interrupt the reader, forcing them to continually go back to re-parse a sentence.

However, if you are writing a document, whether prose or technical, with the intention of having it published you must check with the publisher's guidelines to see if they insist on a particular style.

## Notes:

An end of sentence punctuation mark can be one of: a full stop (.), exclamation mark (!) or question mark (?).

1. If an end of sentence punctuation mark follows a lower case character, $\mathrm{T}_{\mathrm{E}} \mathrm{assumes}$ the punctuation mark indicates the end of the sentence. For example, as in:

Did you see that? I certainly did.
2. Where this isn't the case, use $\rangle_{\nu}$ (backslash followed by a space).

```
This can happen when a sentence contains a lower case abbreviation, e.g. \」like this one.
```

$\qquad$
$\qquad$
3. If an end of sentence punctuation mark follows an upper case character, TEX assumes the sentence hasn't ended at that point. For example, as in:

The G.P. said it was only hypochondria.
4. Where the sentence actually ends with an upper case letter, add \@ after the letter and before the punctuation mark.

```
Yesterday, I saw my G.P\@. Tomorrow I'm going to see the
specialist. specialist.
```

2 Some Definitions

## Note on Typewriter Fonts

Note that \nonfrenchspacing in a monospaced font will insert two spaces between sentences, emulating a typewritten document.

### 2.14 Hyphenation

Words sometimes require hyphenation to help justify paragraphs and prevent overly large areas of white space or protrusions into the right margin. Some word processors by default don't hyphenate words in fully-justified

## 2 Some Definitions

paragraphs, which has led some people to believe that hyphenation is bad. Just because word processors do something a certain way, doesn't mean that it's the correct way. $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ has an excellent hyphenation algorithm, but the default hyphenation pattern is designed for English. If you are writing in another language, use the babel package to switch the hyphenation pattern (see Section 5.8).

Despite using an excellent algorithm, $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ occasionally gets the hyphenation wrong, particularly where the hyphenation is context sensitive. There are two ways of setting the hyphenation for a given word.

1. For all occurrences of the word, use
$\backslash$ hyphenation\{〈hyphenated word $\rangle\}$
inserting a hyphen - at all possible hyphenation points. For example:
\hyphenation\{gal-axy\}
2. For a particular instance of a word, use $\backslash$ - at the hyphenation point within the word. For example:
```
There once was a little alien called Uiop who lived in the
faraway gal\-axy of Zxcv.
```

$\qquad$

## 2．15 Environments

An environment is a block of code contained within the commands
\begin\｛〈env－name〉\}
and
\end\｛〈env－name〉\}
where $\langle\mathrm{env}$－name〉 is the name of the environment．The block of code is then formatted in a method specific to that environment．For example， the bfseries ${ }^{2.6}$ environment will typeset the contents of the environment in a bold font．The following code：
\begin\｛bfseries\}Here is some bold text.\end\{bfseries\} }

[^7]2 Some Definitions
will appear in the typeset document looking like:

## Here is some bold text.

Some environments also supply commands that may only be used within that environment.

## Example:

The itemize environment provides a command called - so that you can specify individual items within an unordered list:
Shopping List:

- Cabbages
- Bananas
- Apples

The above will produce the following output:

## Shopping List:

- Cabbages
- Bananas
- Apples

### 2.16 The Preamble

The preamble is the part of the source code that comes after the scommandandbefore\begin\{document\}(thestartofthe}documentenvironment).Onlyafewspecialcommandsmaybeplacedinthepreamble(suchas\title),andthereareafewspecialcommandsthatmayonlygointhepreamble(suchas\usepackage).Nothingthatgeneratestext(forexample,$\backslash$maketitle)maygointhepreamble.\documentclass\{...\}$\longleftarrow$Thisbitinhereisthepreamble.\begin\{document\}}undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

### 2.17 Lengths

A length register stores dimensions (such as $1 \mathrm{in}, 5 \mathrm{~cm}, 8.25 \mathrm{~mm}$ ). Like control words, length registers start with a backslash and only contain alphabetical characters in their name. These registers are used to determine page layouts etc. For example, the paragraph indentation is given by the length register $\backslash$ parindent. Acceptable units of measurement are listed in Table 2.1. The two relative units "em" and "ex" are dependent on the current font. (The em-value used to be the width of an " M " and the ex-value was the height of the letter " $x$ ", but these days the values are more arbitrary [6].) Use em for widths and ex for heights if you want to use relative values.

To change a length you can use the command:
$\backslash$ setlength $\{\langle\mathrm{cmd}\rangle\}\{\langle$ length $\rangle\}$
where $\langle c m d\rangle$ is the register (for example, $\backslash$ parindent) and $\langle$ length $\rangle$ is the new length. Alternatively, you can add a value to a length using:
$\backslash$ addtolength $\{\langle c m d\rangle\}\{\langle$ length increment $\rangle\}$
The value of a length register can be displayed in your document using

Table 2.1 Units of Measurement

```
pt TEX point: 72.27pt = 1 in
in inch: 1in = 25.4mm
mm millimetre: 1mm=2.845pt
cm centimetre: 1cm = 10mm
ex the "x-height" of the current font
em the width of a "quad" in the current font
sp scaled point: 1sp = 65536pt
bp big point (or PostScript point): 72bp = 1in
dd didôt point: 1dd=0.376mm
pc pica: 1pc=12pt
cc cicero: 1cc=12dd
mu math unit: 18mu = 1em
```

A rubber length is a length that has a certain amount of elasticity. This enables you to specify your desired length but allows $\operatorname{ETTX}_{\mathrm{E}}$ to stretch or contract the space to get the body of text as flushed with the margins as possible.

For example, the paragraph gap \parskip is usually set to Opt plus
[FAQ: Zero
paragraph indent] 1 pt . This means that the preferred gap is 0pt but ETEX can stretch it up to 1 pt to help prevent the page from having a ragged bottom. For example:
\setlength\{ $\backslash$ parindent $\}$ \{Opt $\}$
\setlength\{\parskip\}\{10pt plus 1pt minus 1 pt \}
This is the first paragraph.
This is the second paragraph.
The paragraph indentation is $\backslash$ the $\backslash$ parindent.

This now produces:

2 Some Definitions

This is the first paragraph.
This is the second paragraph. The paragraph indentation is 0.0 pt .
$\qquad$

In this example, the preferred paragraph gap is 10 pt but it will allow for a deviation of up to plus or minus 1 pt.

Note that it's generally best not to change \parskip explicitly as it can cause unexpected complications. If you use one of the KOMA-Script classes, such as scrreprt, you can use the parskip class option that can take the following values: parskip=full (a full line height) parskip=half (half a line height). ${ }^{2.7}$

## Example:

\documentclass[parskip=full]\{scrbook\}

$$
\text { \documentclass[parskip=tull]\{scrbook }\}
$$

[^8]
## 2 Some Definitions

If you want to change any of the page layout lengths（such as \textwidth）， the easiest way to do it is to use the geometry package．This package should have been installed when you installed your $\mathrm{T}_{\mathrm{E}}$ distribution．For example： suppose you want the total text area to be 6.5 in wide and 8.75 in high with a left margin of 0.4 in ，then you would do：
$\backslash u s e p a c k a g e[b o d y=\{6.5 \mathrm{in}, 8.75 \mathrm{in}\}, \mathrm{left}=0.4 \mathrm{in}]\{$ geometry $\}$

## 2．18 Class File

The class file（．cls）defines the page layout，heading styles and various commands and environments needed for a particular type of document． The class file is specified using the command
\documentclass［〈options〉］\｛〈class－name〉\}
where $\langle$ class－name $\rangle$ is the name of the file without the ．cls extension．All LATEX documents must start with this command．This book uses the scrbook class．

## $2.19 \mathrm{~T}_{\mathrm{E}} \mathrm{X}$

$T_{E} X$ is the typesetting language written by Donald Knuth. He wrote a format of $T_{E} X$ called Plain $T_{E X}$, but many people find Plain $T_{E} X$ complicated, so Leslie Lamport wrote a format of $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ called $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ to make it a bit easier to use. You can think of $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ as a go-between converting your instructions into $T_{E X}$. This book mostly uses the term $E T_{E X}$, even if the matter is more general to $\mathrm{T}_{\mathrm{E}} \mathrm{X}$, to avoid complicating matters. Some error messages you may see will be ${ }^{E} T_{E} \mathrm{X}$ messages, some will be $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ messages. $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ error messages tend to be a bit easier to understand than $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ messages. There are other formats of $T_{E} X$, such as ConTeXt, but this book does not cover them.

### 2.20 Perl

$\mathrm{T}_{\mathrm{E}} \mathrm{X}$-distributions such as TeX Live and MiKTeX also include some helper applications that you may find useful. For example, texdoc (Section 1.1) helps you access installed documentation and makeindex helps generate an index for your document. Some of the helper applications are written in a scripting language called Perl, and you must have the perl application installed to be able to use them. Unix-like operating systems should already have it installed. Windows users can choose between several Perl

## 2 Some Definitions

distributions. The most popular seem to be Strawberry Perl and Active Perl. Perl scripts that come with $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ include: epstopdf (converts Encapsulated PostScript (EPS) files to PDF), pdfcrop (crops a PDF file), xindy (a more flexible indexing application than makeindex), texcount (counts the number of words in a ETEX document) and latexmk (runs ETEX and any associated applications, such as bibtex, the required number of times to ensure the document is fully up-to-date).

## 3. From Source Code to Typeset Output

Every time you want to create or edit a $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ document, there are three basic steps you will always need to follow:

1. Write or edit the source code.
2. Pass the source code to the latex or pdflatex application ("ETEX the document").

- If there are any error messages, return to Step 1.
- If there are no error messages, a PDF file is created.

3. View the PDF file to check the result. If you need to modify your document, go back to Step 1.

You will therefore need:

1. A text editor (to perform Step 1). For example Vim, Emacs or Gedit.
2. The $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ software (to perform Step 2). If you don't already have $\mathrm{T}_{巨} \mathrm{X}$ on your machine, you will need to install it. The most convenient way to do this is to install from the TEX Collection DVD ROM, which is distributed to all $\mathrm{TEX}_{\mathrm{E}}$ User Group ${ }^{3.1}$ (TUG) members, but you can also download and install free $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ distributions, such as TeX Live, MiKTeX or MacTeX, from the Internet (see on the following page). There is also proTeXt, an enhancement of MiKTeX that aims to be an easy-to-install TEX Distribution. For more information including up-to-date links, go to http://www.ctan.org/starter.html.
3. A PDF viewer (to perform Step 3). For example Adobe Reader, Sumatra, Evince or Okular.

This can be rather complicated for a beginner, especially for those with no experience writing computer code. Fortunately, there are some all-inone applications (often called a front-end) that provide a text editor (for Step 1), buttons or menu items to run the latex or pdflatex commandline application (for Step 2) and, in some cases, a viewer to perform Step 3.

Section 3.1 describes one such front-end called TeXWorks. I have chosen to describe TeXWorks because it is a free, cross-platform application. Binaries are available for Microsoft Windows, Mac OS X and GNU/Linux. The

[^9][FAQ: (La)TeX for
screen shots of TeXWorks in this book were taken from the Linux version running under Fedora. If you run TeXWorks on other operating systems, it may have a slightly different look, but it has the same functionality.

New versions of TeX Live and MiKTeX include TeXWorks for MS Windows, and new versions of MacTeX include TeXWorks for Mac OS X users. GNU/Linux users can use their Add/Remove Software utility to install TeXWorks. Alternatively, you can download TeXWorks by following the links provided at http://www.tug.org/texworks/.

If you're confused by all the options, let's keep things as simple as possible:

- MS Windows:

You have a choice between MiKTeX (or proTeXt) and TeX Live. MiKTeX provides a smaller and quicker installation, but the downside is that you may not have the classes or packages you want to use. MiKTeX can install these whenever you try to $\mathrm{LATEX}^{2}$ a document that uses them, but you need an Internet connection while it does this. TeX Live installs everything, so it takes longer and needs more space, but you should have the majority of packages and classes that you need.

## TeX Live:

1. Fetch and unpack http://mirror.ctan.org/ systems/texlive/tlnet/install-tl.zip
2. Run install-tl and follow the instructions. This can take an hour or more.
proTeXt:
3. Go to http://tug.org/protext/
4. Click on the "download the self-extract protext.exe" link to download and run the executable.

## MiKTeX:

1. Go to http://www.miktex.org/
2. In the left-hand panel, there is a link to the download page for the latest version. At time of writing, it is MiKTeX 2.9. Click on that link.
3. Scroll down to the section "Installing a basic MiKTeX system".
4. If you're happy with the selected mirror location, click on the "Download" button.
5. Run the executable.

- Mac OS X:

1. Go to http://tug.org/mactex/
2. Follow the instructions on that page.

- GNU/Linux:

1. Fetch and unpack http://mirror.ctan.org/systems/texlive/
tlnet/install-tl-unx.tar.gz
2. Follow the instructions at http://tug.org/texlive/quickinstall. html
3. Once TeX Live has finished installing, run your system's "Add/Remove Software" tool.
4. Find "texworks", select the newest version and install.

If you run into problems, there are mailing lists at http://tug.org/ mailman/listinfo/tex-live and http://docs.miktex.org/manual/lists. html for TeX Live and MiKTeX, and MacTeX help at http://www.tug.org/ mactex/help/. There is also a list of places where you can ask for help in Appendix C (Need More Help?).

### 3.1 TeXWorks

Hopefully you've managed to successfully install $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ and TeXWorks as described above, so let's test it out.

First run TeXWorks. On Windows, you can access it via the Start menu. On GNU/Linux, it's probably located in Applications $\rightarrow$ Office, or you can type texworks in a terminal. You should now see the TeXWorks window. The button marked with a grey triangle in a green circle is the build or typeset function. It runs the application in the drop-down list next to it. This is set to pdfLaTeX, which is what we want for now.

It's a good idea to switch on the syntax highlighting, if it isn't already on. This is done via the Format $\rightarrow$ Syntax Coloring sub-menu. Make sure the LaTeX item is selected.

Next, type in the following sample source code, as shown in Figure 3.1 (the commands used here will be described in more detail in Chapter 4 (Creating a Simple Document)):

This is an example document.
\end\{document\} }

Pay close attention to the backslashes at the start of each command name. If you find the font is a bit too small for you, you can make it larger using the Format $\rightarrow$ Font menu item. This doesn't affect the font size in your PDF file, just the font size of your code. This displays the "Select Font" dialog box. Set the font size as appropriate.

Then save the document, using the File $\rightarrow$ Save As menu item. I called my document example1.tex (remember the .tex extension and stick to file names that only consist of alphabetical characters, digits and hyphensdon't uses spaces or underscores).

Now that you have saved the file, you can run pdfLaTeX. Make sure the drop-down list next to the build button has "pdfLaTeX" selected and click on the build button. If all goes well, a new window should open displaying the typeset document (Figure 3.2).

Now let's see what happens if there is an error in the source code. In Figure 3.3 I have misspelt the \documentclass command. This time, when I click on the build button, I get the error message:
! Undefined control sequence.

3 From Source Code to Typeset Output

Figure 3.1 Source Code for an Example Document. (Syntax highlighting switched on.)

3 From Source Code to Typeset Output

Figure 3.2 The Typeset Document

3 From Source Code to Typeset Output

Figure 3.3 The Source Code Has a Misspelt Command
1.1 \documentclas

```
{scrartcl}
```

?
(Shown in Figure 3.4.)
Here "Undefined control sequence" means an unrecognised command, and below that message, " 1.1 " means the error was encountered on line 1. An input line at the bottom of the window has appeared with a cursor. ${ }^{A T} T_{E} \mathrm{X}$ is in interactive mode and is awaiting a response. There are several responses, but I'm only going to mention two of them:

1. Type $h$ and press the Return/Enter key $\longleftarrow$. This displays a short help message and awaits a new response (see Figure 3.5).
2. Type x and press Return/Enter. This aborts the $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ run.

Notice that the green circle button with the grey triangle has turned into a red stop button. This button can be used to abort the process instead of typing x .

Now, there is a second tab at the bottom of the TeXWork's window (Figure 3.6). This lists the error message and provides a link to the line where the error occurred. Clicking on this link highlights line 1. Next I need to fix the error by correcting the spelling of the command. Once it's fixed, I can click on the build button.

Figure 3.4 An Error Message is Displayed

Figure 3.5 A Short Help Message

Figure 3.6 Error Tab

## 3 From Source Code to Typeset Output

Here's another error you might encounter: I'm now going to misspell the class name. It should be scrartcl, but in Figure 3.7 it has been misspelt. This time, when I click on the build button, I get the error:
! LaTeX Error: File 'scrartc.cls' not found.
I have two choices: type in the correct name on the line below "Enter file name:" or I can abort the process using the red abort button. In either case I need to go back and fix the error in my code.

Figure 3.7 Misspelt Class File

## 4．Creating a Simple Document

Having installed and tested the software，let＇s now look at how to actually write the source code．The very first line of any document that you create must have the command：
\documentclass［〈option－list $\rangle]\{\langle$ class－name $\rangle\}$
This tells $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ what type of document you want to create（for example an article，a technical report or correspondence）．The \documentclass command takes one mandatory argument，〈class－name〉，that specifies the class file．

There are many class files available，and some publishers，institutions or journals provide their own custom classes（for example，the jmlr class for the Journal of Machine Learning Research）．Popular classes include memoir （for books and reports）and those supplied in the KOMA－Script bundle （for books，reports，articles and correspondence）．There＇s also beamer（for presentations）as well as classes for typesetting exams，flashcards，concert programmes etc．For simplicity，this book will concentrate on three of
the KOMA-Script classes scrartcl (for articles), scrreprt (for technical reports, theses etc) and scrbook (for books).

We'll start with a very simple document, so let's use the scrartcl class file. In this case the very first line of the source code should be:
\documentclass\{scrartcl\}
The \documentclass command also takes an optional argument, 〈optionlist $\rangle$, which should be a comma separated list of options to be passed to the class file. This allows you to override the class file defaults. For example, the scrartcl class file by default uses A4 paper, but if you are in the USA you will probably want to use letter paper. This can be achieved using the option letterpaper. So you would need to edit the above line to:
\documentclass[letterpaper]\{scrartcl\}
Let's change another option. The normal font size is 11 pt by default, but we have the option to change it, so let's use 12 pt :
$\backslash$ documentclass[letterpaper, 12pt] \{scrartcl\}
You can also change your document so that it is in a two-column format using the twocolumn option:
\documentclass[letterpaper,12pt, twocolumn]\{scrartcl\}

After deciding what type of document you want, you now need to specify the contents of the document. This is done inside the document environment. The document is started with the command:
\begin\{document \} }
and ended with
\end\{document\} }
(ETEX stops reading the file when it reaches the above line, so anything occurring after it is ignored.)

My source code now looks like:
\documentclass[12pt]\{scrartcl\}
\begin\{document\} }
\end\{document\} }
Every document you create must have this form. You can't simply start typing the document text. You must first specify your class file, and then place the contents of the document inside the document environment.

4 Creating a Simple Document
So far so good, but at the moment we have an empty document, so we won't get any output. Let's now put some text into our document:
\documentclass[12pt]{scrartcl}
$$
\begin{document}
This is a simple document.
Here is the first paragraph.
Here is the second paragraph. As you
can see it's
a rather
short paragraph, but not as short as the previous one.
\end{document}
$$

```
\(\qquad\)

\section*{Top Five Mistakes Made by New Users}
```

I first started teaching ETEX in 1998, and these are the most common errors I've seen when people start learning LATEX:

1. Missing out the backslash $\backslash$ at the start of one or more of the commands.
2. Using a forward slash / instead of a backslash $\backslash$.
3. Forgetting \end\{document\}. }
4. Misspelling "document" (in $\backslash$ begin \{document \} and $\backslash e n d\{d o c u m e n t\}$ ).
5. Missing a closing brace \}.

If you encounter any problems when you start out, go through that check list first. Then check Appendix B (Common Errors).

Whenever you start a new document, always type in the \documentclass, $\backslash$ begin\{document\} and $\backslash e n d\{d o c u m e n t\}$ commands first (Figure 4.1). Then move your cursor between the $\backslash$ begin and $\backslash$ end lines and type the document text (Figure 4.2).

## Exercise 1 (Simple Document)

Try typing the code in the above example into TeXWorks or the editor of your choice (see Chapter 3 (From Source Code to Typeset Output) if you can't remember what to do.) You can also download a copy of this file, but I recommend that you try typing it in to give yourself some practice.

4 Creating a Simple Document

Figure 4.1 Starting a New Document: always type these three lines first.

Figure 4.2 Starting a New Document: move the cursor inside the document environment and start typing the document text.

Things to note while you are typing: firstly, when you press the return character at the end of a line this end-of-line character is converted into a space in the output file. So the fact that I have some very ragged lines in my source code has no effect on the final result. (Note that some frontends will reformat your lines as you type.) Whereas a completely blank line will be converted into a paragraph break ( $\backslash$ par has the same effect).

Secondly, multiple spaces are converted into a single space, so the large gap between the words "can" and "see" is no different from having a single space.

Once you have typed up your source code, save your file (called, for example, exercise1.tex), and run PDFETEX as described in Section 3.1. If all goes well, TeXWorks should display the resulting PDF file in a new window, usually alongside the window containing the source code.

## Notes:

1. Each paragraph automatically starts with an indentation in the PDF.
2. There is no blank line between the paragraphs in the PDF document. (See what happens if you add the KOMA-Script class option parskip=full:
\documentclass[12pt,parskip=full]\{scrartcl\}
and rebuild the PDF.)
3. Move the mouse over one of paragraphs in the PDF viewer and pop-up the context menu (usually a right mouse click). Select Jump to Source. The window containing the source code should now gain the focus and the line of code matching the typeset line you clicked on in the PDF should now be highlighted.

### 4.1 Using Simple Commands

Now let's try adding a few simple commands to our document. The command $\backslash$ LaTeX produces the LATEX logo and the command \today prints the current date. $\mathrm{ET}_{\mathrm{EX}}$ always ignores any spaces that follow a command name that consists of letters, as it uses the space to indicate the end of the command name. This means that if we want a space to occur immediately after the command, we need to explicitly say so using the command $\rangle_{\nu}$ (recall from earlier $\llcorner$ indicates a space character). So, for example:
$\backslash$ LaTeX $\backslash \_$logo
produces the output:
LeTEX logo
[FAQ: Typesetting
all those
TeX-related logos]

Input

Output

Some people when starting out can get a bit confused by this and read it as the entity " $\backslash$ LaTeX $\backslash$ " whereas it is in fact two commands: " $\backslash$ LaTeX" (print the $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ logo) followed " $\backslash$ " (print a space.)

Let's also try using a command that takes an argument. The command
$\backslash$ footnote $\{\langle$ text $\rangle\}$
takes one argument that specifies the text that should appear in the footnote. This command must be placed where you want the footnote marker to appear.

## Exercise 2 (Using Simple Commands)

Edit the document you created in Exercise 1, so that it looks like the following: (You can download it if you like, but again it is better if you try typing it in yourself.)
\documentclass[12pt]\{scrartcl\}
\begin\{document\} }

This is a simple $\backslash$ LaTe $\backslash_{\llcorner }{ }^{\text {document. }}$ Here is the first paragraph.
Here is the second paragraph $\backslash$ footnote\{with a footnote\}. As you can see it's a rather short paragraph, but not as short as the previous one. This document was created on: \today. \end\{document\} }

Now LATEX your document and view the result. (Remember to check Appendix B (Common Errors) if you have a problem.) You should see the LTEX logo, the footnote marker and the current date. If you scroll down to the bottom of the page, you should see the footnote.

### 4.2 Packages

Packages are files with the extension .sty that either define new commands or redefine existing commands. They're like a type of add-on or plug-in. Most of the commonly used packages should have been installed when you installed your $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ distribution (see Chapter 3 (From
[FAQ: What are
LaTeX classes and packages?] Source Code to Typeset Output)). Appendix A (Downloading and Installing

Packages) covers how to install new packages. Most packages come with documentation that can be accessed using the texdoc application described in Section 1.1.

Packages are loaded in the preamble (after ntclassandbefore\begin\{document\})using}\usepackage[〈optionlist$\rangle]\{\langle$package$\rangle\}$where$\langle$package$\rangle$isthenameofthepackageand$\langle$optionlist$\rangle$isalistofcomma-separatedoptions.Forexample,toloadthepackagegraphicxwiththedraftoption:\usepackage[draft]\{graphicx\}Anyapplicableclassoptionsarealsopassedtopackages,soinundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

```
\documentclass[draft]{scrartcl}
\usepackage{graphicx}
the draft option is set for both the scrartcl class and the graphicx package.
You can specify more than one package in the argument of \usepackage, where each package name is separated by a comma. For example:
\usepackage\{amsmath, amsfonts\}
The graphicx package is covered in Chapter 6 (The graphicx Package) and the amsmath package is covered in Chapter 9 (Mathematics), so let's start out with a relatively simple example.

\subsection*{4.2.1 Changing the Format of \(\backslash\) today}

In the previous exercise, we used the \today command to produce the current date. By default, this command displays the date in US format. To illustrate how to use packages, this section will look at how to use the datetime package to change the way that \(\backslash\) today displays the date.

The datetime package has various options that can be used to change the format of \today. For example, by default the datetime package redefines \today to display the date in the form: Tuesday \(25^{\text {th }}\) September, 2012. The option short will produce an abbreviated form, (for example Tue \(25^{\text {th }}\) Sept, 2012) and the option nodayofweek won't display the day of the week (for example \(25^{\text {th }}\) September, 2012). For those who don't like the raised ordinal, there is the level option. These can be passed as a comma separated list in the optional argument to the \usepackage command. It is also possible to use a declaration instead. For example, to redefine \today to display the date in the form 25/09/2012, you can either do
\usepackage[ddmmyyyy]\{datetime\}

\section*{or}
\usepackage\{datetime\}
\ddmmyyyydate

The datetime package also defines the command
which displays the current time, where again the format can be changed by the package options. So the option 12 hr will cause \currenttime to display the date in 12 hour format (for example, 9:07pm) and the option 24 hr will cause \currenttime to display the date in 24 hour format (for example, 21:07).

\section*{Exercise 3 (Using the datetime Package)}

Edit your document from Exercise 2 so that it uses the datetime package. Experiment with the different package options, for example
\usepackage[short, nodayofweek,level,12hr]\{datetime\}
and add the current time
This document was created on: \today\」at \currenttime.
You can download or view an example. For a full list datetime of package options, see the datetime documentation. (Refer to Section 1.1 on how to find package documentation.)

\subsection*{4.3 Special Characters and Symbols}

You can use most of the standard characters that you find on your keyboard, but the 10 symbols shown in Table 4.1 have a special meaning.

Table 4.1 Special Characters
\[
\left\} \% \& \$ \#_{-}{ }^{\wedge} \sim 1\right.
\]

We have already used the curly braces \{ and \}. The percent symbol \% is a comment character. Everything from the percent symbol up to the end of line is ignored by ETEX. This means you can have comments in your source code to remind you what a particular part of your code is doing. We have also used the backslash symbol \(\backslash\) which indicates that we
are using a \(\mathrm{ETT}_{\mathrm{E}} \mathrm{X}\) command, as in \(\backslash\) LaTeX or \(\backslash\) today. The meaning of the other special characters will be covered later.

So what do you do if you want one of these symbols to actually appear in your document? Table 4.2 lists commands that produce these and other symbols. Note that some of the commands have short cuts, such as --instead of \textemdash and ? ‘ instead of \textquestiondown.

The symbol ' is the backtick (or grave) symbol, as opposed to the apostrophe symbol '. The backtick symbol usually looks like ` on a keyboard,
[FAQ: Where can I find the symbol for ...?]
[FAQ: How to get copyright,
trademark, etc] and on most UK keyboards it is situated to the left of the 1 key. The opening double quote is created using two adjacent backtick symbols and the closing double quote with two adjacent apostrophe symbols. This gives 66 and 99 style quotes, which you wouldn't get using the double quote symbol on your keyboard.

Note that the symbols | < and > have to be created using \textbar, \textless and \textgreater when in normal text mode. If you try to enter them using the corresponding keyboard characters you may get \(i\) and \(i\). (They do however work if you are in maths mode. \({ }^{4.1}\) ) The slash character / may be used directly, as in "and/or", but no line break will be permitted at the slash, whereas \slash (as in "and \(\backslash\) slash_or") will allow a line break at that point.

Ligatures and special symbols are shown in Table 4.3. (Note that, as

\footnotetext{
\({ }^{4.1}\) There are also some text fonts that will display them correctly, but don't rely on it.
}

Table 4.2 Symbols
\begin{tabular}{|c|c|c|c|c|c|}
\hline \textbackslash & \(\backslash\) & \slash & 1 & \textgreater & > \\
\hline \textasciicircum & \(\wedge\) & \\$ & \$ & \textbar & \\
\hline \(\backslash\) textasciitilde & \(\sim\) & \\{ } & \{ & \textless & < \\
\hline \(\backslash\) pounds & £ & \\\(}\) & \} & \(\backslash\) dag & \(\dagger\) \\
\hline \textregistered & \({ }^{\text {® }}\) & \\# & \# & \(\backslash\) ddag & \(\ddagger\) \\
\hline \texttrademark & тм & \\% & \% & , or \textquoteright & \\
\hline \(\backslash\) copyright & © & \\& & \& & ' or \textquoteleft & \\
\hline \(\backslash\) textbullet & \(\bullet\) & \i & 1 & , ' or \textquotedblright & \\
\hline ?‘ or \textquestiondown & i & \j & J & ' ' or \textquotedblleft & \\
\hline !' or \textexclamdown & i & - & - & -- or \textendash & - \\
\hline --- or \textemdash & - & \S & \(\S\) & \(\backslash\) textperiodcentered & \\
\hline \(\backslash 1\) dots & \(\ldots\) & \(\backslash \mathrm{P}\) & T & \_ or \textunderscore & - \\
\hline
\end{tabular}
mentioned in the introduction, the f-ligatures are automatically converted.) When using a command in the middle of a word, take care that the command doesn't run into the rest of the word. For example, the British spelling of the word manœuvre has an œ-ligature in the middle of it. You will get an error if you try:
man\oeuvre
as \(\operatorname{ET}\) EX will interpret it as the command \oeuvre which doesn't exist.
There are several ways to code this in \(\mathrm{IT}_{\mathrm{E}} \mathrm{X}\) :
1. Place a space after the command:
```

man\oe_uvre

```
2. Place an empty brace after the command: man\oe\{\}uvre
3. Group the command:
(This can adversely affect the kerning so is best avoided.)

Table 4.3 Ligatures and Special Symbols (Computer Modern Font)
\begin{tabular}{|c|c|c|c|c|c|c|c|}
\hline \(\backslash \mathrm{AE}\) & Æ & \(\backslash \mathrm{ae}\) & æ & \OE & (E & \oe & œ \\
\hline fi & fi & ffi & ffi & fl & \(f\) & ffl & ffl \\
\hline \(\backslash\) AA & \(\AA\) & \(\backslash \mathrm{aa}\) & å & \L & も & \(\backslash 1\) & \(\mathfrak{l}\) \\
\hline \(\backslash 0\) & \(\varnothing\) & \o & \(\varnothing\) & \SS & SS & \ss & B \\
\hline
\end{tabular}

English speakers are by and large very lackadaisical when it comes to accents, but accents affect pronunciation, and so are just as important as the correct spelling. There is a big difference between putting your knife into someone's pâté (meat paste), and putting your knife into someone's pate (head)!

Accented letters are created by specifying which accent you want, and the letter on which to put the accent. The accent commands are listed in Table 4.4, and each command takes one mandatory argument. The command indicates what accent to use, and the argument indicates the letter on which to put the accent.

You may have noticed in Table 4.2 the commands \(\backslash i\) and \(\backslash j\) which produce a dotless \(\mathbf{i}\) and \(\mathbf{j}\) ( 1 and j ). With old versions of ETEX (or \(\mathrm{T}_{E} \mathrm{X}\) ) an accent over a normal " \(i\) " or " j " left the original dot in, which is incorrect, so a dotless " 1 " or " " " were required. With modern distributions, an accented
" i " or " j " is correctly rendered.

\section*{Example:}

It's na\"ive to think that eating mouldy \(p \backslash \wedge a t \backslash ' e\) won't result
in food poisoning.
Result:
It's naïve to think that eating mouldy pâté won't result in food poisoning.

This book only covers a very small subset of available symbol commands. If the command you want isn't here, try Scott Pakin's comprehensive symbol list [10]. Another useful resource is detexify.

\subsection*{4.3.1 The inputenc Package}

Instead of using the accent and ligature commands described above, you can use the inputenc package and enter the character directly, but you must ensure you match the encoding with that used by your text editor. For example, this book uses UTF8 encoding so I have loaded the inputenc package in the preamble with the utf8 option:

Table 4．4 Accent Commands
\begin{tabular}{|c|c|c|c|c|c|}
\hline \multirow[b]{2}{*}{Definition} & \multicolumn{2}{|c|}{Example} & \multirow[b]{2}{*}{Definition} & \multicolumn{2}{|r|}{Example} \\
\hline & Input & Output & & Input & Output \\
\hline \＇\｛〈object \(\rangle\) \} & \＇\｛c\} & ć & \(\backslash=\{\langle\) object \(\rangle\) \} & \＝\｛c\} & \(\overline{\mathrm{c}}\) \\
\hline \＇\｛〈object \(\rangle\) \} & \＇\｛c\} & c̀ & \．\(\{\langle\) object \(\rangle\) \} & \．\(\{\mathrm{c}\}\) & \(\dot{\text { c }}\) \\
\hline \＾\｛〈object \(\rangle\) \} & \(\backslash \wedge\{c\}\) & c & \(\backslash \sim\{\) object \(\rangle\) \} & \～\｛c\} & c \\
\hline \＂\｛ \({ }^{\text {object } t \text { \} }}\) & \＂\｛c\} & с̈ & \(\backslash \mathrm{v}\{\langle\) object \(\rangle\) \} & \v c ¢ & č \\
\hline \(\backslash u\{\langle\) object \(\dagger\) \} & \u\｛c\} & č & \(\backslash \mathrm{H}\{\) object \(\rangle\) \} & \(\backslash \mathrm{H}\{\mathrm{c}\}\) & č \\
\hline \(\backslash \mathrm{t}\{\langle\) object \(\rangle\) \} & \(\backslash \mathrm{t}\{\mathrm{xy}\}\) & xy & \c \(\{\langle\) object \(\rangle\) \} & \c\｛c\} & C \\
\hline \(\backslash \mathrm{d}\{\langle\) object \(\dagger\) \} & \(\backslash \mathrm{d}\{\mathrm{c}\}\) & ¢ & \(\backslash \mathrm{b}\{\langle\) object \(\rangle\) \} & \(\backslash \mathrm{b}\) ¢ c \} & c \\
\hline \(\backslash \mathrm{r}\{\langle\) object \(\dagger\) \} & \(\backslash \mathrm{r}\{\mathrm{c}\}\) & ć & & & \\
\hline
\end{tabular}
\usepackage[utf8]\{inputenc\}
Note that it's a good idea to also use the fontenc package as well. For example, if you want to use Type 1 fonts:

Returning to an earlier example, I can directly enter the Unicode character \((\mathrm{U}+0153)\) for the lower case œ ligature:
manœuvre
Note that if you are collaborating on a document and you want to use this approach, you must ensure that all your co-authors use the same input encoding. For example, suppose you decide to use ISO Latin 1 encoding (latin1 option):
\usepackage[latin1] \{inputenc\}
but your co-author is using a UTF-8 editor and types:
naïve
where \(i\) is the Unicode character U+00EF. UTF-8 characters use one to four 8-bit bytes whereas ISO Latin 1 uses an 8-bit single-byte character set. So the \(\mathrm{U}+00 \mathrm{EF}\) binary sequence is interpreted by ISO Latin 1 encoding as two characters: \(\tilde{A}(0 x C 3)\) and \({ }^{-}\)( 0 xAF ). Therefore the resulting PDF file will end up containing the rather odd looking:
na \(\tilde{A}^{-}\)ve
(If you are using TeXWorks, you can set your preferred encoding using Edit \(\rightarrow\) Preferences and select the "Editor" tab where there is an "Encoding" setting. Make sure this setting matches the inputenc option you use in your document.)

\section*{Exercise 4 (Using Special Characters)}

Start a new file in TeXworks, and see if you can write the source code to create the output below. (Ignore any hyphenation that may appear below, \(\mathrm{ET}_{\mathrm{E}} \mathrm{X}\) does that automatically where necessary, see Section 2.14. Likewise, ignore where the line breaks occur, except for the paragraph break.) Choose whether you want to use the inputenc package or if you want to use commands such as \(\backslash c\), but in either case you need to be careful of the special characters.

Item \#1: Our travel expenditure came to \(\$ 2000.00\) \& our equipment expenditure came to \(£ 100.00\) plus VAT @ 17.5\%.

Chloë collected Zoë from the crèche. They stopped to admire the façade of a new café and then went to a matinée.

You can download or view the source code if you can't work out how to do it, and remember to check Appendix B (Common Errors) if you have a problem.

\subsection*{4.4 Lists}

Now you've had a go at using some commands, let's use some environments (recall Section 2.15). A good example of environments are the list making environments. There are three basic list making environments: itemize (for unordered lists), enumerate (for ordered lists) and description (for lists where you want to specify your own label.)

In each of these environments, each item in the list must be started with the command:

The optional argument 〈marker〉 can be used to override the default marker for that particular item．（For example，to replace the bullet point for an individual item in an unordered list to make that item stand out from all the other items．）We will be looking at how to change the default marker in Section 8．2．

\section*{Related UK FAQ［18］topics：}
－Perhaps a missing \item？
－Fancy enumeration lists
－How to adjust list spacing
－Interrupting enumerated lists
－＂Too deeply nested＂

\section*{4．4．1 Unordered Lists}

Unordered lists are created using the itemize environment．

\section*{Example:}
```

- Animal
- Vegetable
- Mineral

- Animal
- Vegetable
- Mineral

## Another Example:

Changing the default markers is covered in Section 8.2, but it's also possible to override the default marker for a particular item, as in this example (recall the double-dagger symbol command \ddag from Table 4.2):

4 Creating a Simple Document
\begin\{itemize\} }
- Animal
- Vegetable
- Mineral
\end\{itemize\} }

- Animal
$\ddagger$ Vegetable
- Mineral

Be careful about using square brackets [] inside an optional argument. Grouping is required, as in:

4 Creating a Simple Document

```
\begin{itemize}
\item Animal
\item[{[X]}] Vegetable
\item Mineral
\end{itemize}
- Animal
[X] Vegetable
- Mineral

Similarly if the item starts with an open square bracket [, as in:
\begin\{itemize\} }
\item Animal
\item \{[sic]\} Wegetable

4 Creating a Simple Document
\item Mineral \end\{itemize\} }
- Animal
- [sic] Wegetable
- Mineral
\(\square\)

\section*{Nested Lists}

It is also possible to nest itemize environments. The following example has three levels, each using its own default marker.
\(\backslash\) begin\{itemize\}
\item Animal
\(\backslash\) begin\{itemize\}

4 Creating a Simple Document
```

- Mammals
- Birds
- Reptiles. For example:

- dinosaurs
- crocodiles

\end{itemize}
- Vegetable

- Cultivated
- Wild

- Mineral
\end{itemize}

```
- Animal
- Mammals
- Birds

4 Creating a Simple Document
- Reptiles. For example:
* dinosaurs
* crocodiles
- Vegetable
- Cultivated
- Wild
- Mineral
\(\qquad\)
You might have noticed the code in the above example is a little difficult to read. Each new list item starts a new paragraph, so it doesn't matter if we have blank lines before each item. Also, recall from Chapter 2 (Some Definitions) that spaces at the start of each line of code are ignored, so it's possible to make the code more readable without affecting the final result:

4 Creating a Simple Document
\begin\{itemize\} }
\item Animal
\begin\{itemize\} }
\item Mammals
\item Birds
\item Reptiles. For example:
\begin\{itemize\} }
\item dinosaurs
\item crocodiles
\end\{itemize\} }
\end\{itemize\} }

4 Creating a Simple Document
```

    \item Vegetable
    \begin{itemize}
    \item Cultivated
    \item Wild
    \end{itemize}
    \item Mineral
    \end{itemize}

```
\(\qquad\)
It's now a little easier to see which \begin\{itemize\} matches up with } the corresponding \end\{itemize\}. }

\section*{Example (Four Levels)}

This example has four levels, which is the maximum allowed by most classes.

4 Creating a Simple Document
```

- Animal
    - Mammal
        - Placental
        - Monotreme
            - Platypus
        - Marsupial
            - Kangaroo
        - Koala
Previous Next First Last Back Forward Summary Index
108

4 Creating a Simple Document
\end\{itemize\} }
\end\{itemize\} }

            - Reptile
\end\{itemize\} }
            - Vegetable
        - Mineral
\end\{itemize\} }
1 Animal
2 Mammal
3 Placental
4 Monotreme
5 Platypus
6 Marsupial

4 Creating a Simple Document
7 Kangaroo
8 Koala
9 Reptile
10 Vegetable
11 Mineral
$\qquad$
If you try adding a further level, ETEX will give a "Too deeply nested" error.

 4.4.2 Ordered Lists

Ordered lists are created using the enumerate environment. It has exactly the same format as the itemize environment described above.

We can use the same example as before, only this time use enumerate instead of itemize.

4 Creating a Simple Document

                undefined. Animal
                NaN. Vegetable
                NaN. Mineral
L

The above input will produce the following output:

1. Animal
2. Vegetable
3. Mineral

As before, the marker for a particular item can be overridden:

4 Creating a Simple Document
```                1. Animal
                2. }] Vegetable
                3. Mineral
\(\qquad\) 1. Animal [X] Vegetable 2. Mineral \(\square\)  \section*{Example (Nested):}  As with the itemize environment, most classes allow a maximum of four nested enumerate environments.  4 Creating a Simple Document                1. Animal
                    1. Mammal
                        1. Placental
                        2. Monotreme
                            1. Platypus
                        3. Marsupial
                            1. Kangaroo
                            2. Koala

4 Creating a Simple Document
\end\{enumerate\} }
\end\{enumerate\} }
                            3. Reptile
\end\{enumerate\} }
                            4. Vegetable
                            5. Mineral
\end\{enumerate\} }
1. Animal
a) Mammal
i. Placental
ii. Monotreme
A. Platypus
iii. Marsupial
A. Kangaroo
B. Koala
b) Reptile
2. Vegetable
3. Mineral
$\qquad$

\subsection*{4.4.3 Description Environment}

The description environment has the same format as the itemize environment described in Section 4.4.1, only this time you need to specify a marker as an optional argument to the
                        4. command, since there is no default marker for this environment. The marker may be a textual label, and most classes will typeset it in bold. The KOMA-Script classes, such as scrartcl, default to a bold sans-serif font, as illustrated in this next example:

\begin{description}

                            6. Living being
                            7. Plant
                        5. Natural inorganic substance
\end{description}

Vegetable Plant
Mineral Natural inorganic substance

The KOMA-Script classes provide a way of changing the font style in the description label markers. (The font changing commands \normalfont and \scshape will be covered in Section 4.5, and the KOMA-Script command \addtokomafont in Section 5.3.)

4 Creating a Simple Document

\addtokomafont{descriptionlabel}{\normalfont\scshape}
\begin{description}
                            8. Living being
                            9. Plant
                        6. Natural inorganic substance
\end{description}

\(\qquad\)

Animal Living being
Vegetable Plant

Mineral Natural inorganic substance
\(\qquad\)

It is possible to nest all the listing environments, as long as you don't exceed four itemize and four enumerate environments. The description environment has no restriction on the number of times it can be nested. However, just because you can do something, doesn't mean you should. In general it's best to avoid an excessively complicated block of text in your document.

Example (Assorted Nesting):
This example uses each of the listing environments described above.

4 Creating a Simple Document
\begin\{enumerate\} }

                            10. dinosaurs
                            11. crocodiles
\end\{enumerate\} }
\end\{itemize\} }
                            12. Plant
\begin\{itemize\} }
                            13. Cultivated. For example:
$\backslash$ begin\{enumerate\}
                            14. Carrots
                            15. Broccoli

4 Creating a Simple Document
                            16. Potatoes
\end\{enumerate\} }
                            17. Wild
\end\{itemize\} }
                        7. Natural inorganic substance
\end\{description\} }

Animal Living being
12 Mammals
13 Birds
14 Reptiles. For example:

15 dinosaurs
4 Creating a Simple Document
2. crocodiles

Vegetable Plant
1 Cultivated. For example:

2 Carrots
3 Broccoli
4 Potatoes
1 Wild

Mineral Natural inorganic substance
$\qquad$

 Exercise 5 (Lists)

Try writing the source code that will create the output shown below.

4 Creating a Simple Document

Village A small collection of dwelling places. Examples:

2 Marlingford
3 Saxlingham Nethergate
Town A large collection of dwelling places. Examples:

1 Great Yarmouth
2 Beccles
City A large town, usually containing a cathedral. Examples:

1 Norwich
2 Birmingham
3 London
You can download or view the answer if you can't work out how to do it.

 4.5 Fonts

${ }^{\text {ETTEX }}$ E uses Donald Knuth's Computer Modern fonts by default. This supplies three font families: serif, sans-serif and a typewriter (or monospaced) font (as well as the maths fonts which are discussed in Section 9.4.1). With each font family, you can change the shape and weight, as well as the size.

 4.5.1 Changing the Font Style

There are two basic ways of changing fonts: you can either change the font for a small selection of text, for example, if you want to emphasize a word, or you may wish to change the font "from this point onwards". The commands shown in Table 4.5 are of the first type (text-block commands), whereas those shown in Table 4.6 are of the second type - a declaration (or modal command).

 Note:

Don't be tempted to use $\backslash \mathrm{bf}$, $\backslash \mathrm{md}$, \it, \sl, \sc, \sf, \tt or $\backslash \mathrm{rm}$. These commands are obsolete [15].

If you use an italic or slanted font declaration, such as \itshape, you will need to add an italic correction $\backslash /$ at the end of the block of text, when the last letter of the sloping text leans too far over. This isn't necessary for text-block commands, such as $\backslash$ textit, just for the modal commands.
[FAQ: Using
PostScript fonts
with TeX ]
[FAQ: What's

The effect is more noticeable when part of a word is stressed, particularly with certain fonts.

 Example:

In the code below, the first instance of "repeated" doesn't have an italic correction but the second does:
$\{\backslash i t s h a p e ~ r e p e a t e d\} l y ~\{\backslash i t s h a p e ~ r e p e a t e d \backslash /\} l y ~$
Input
Using Computer Modern:
repeatedly repeatedly
Output
Using Helvetica:
repeatedy repeatedly
Output
Using Antykwa Toruńska typeface:
repeatedly repeatedly
Note that if you want to typeset an URL, rather than using \texttt it is better to use
\url\{〈address $\rangle\}$
which is defined in the url package. For example:

Table 4.5 Font Changing Text-Block Commands

| Command | Example Input | Corresponding output (Computer Modern) |
| :---: | :---: | :---: |
| $\backslash$ textrm\{ $\left.\left.\operatorname{tex}^{\text {ext }}\right\rangle\right\}$ | \textrm\{roman\} text | roman text |
|  | \textsf\{sans serif\} text | sans serif text |
| $\backslash \mathrm{texttt}\{\langle$ text $\rangle\}$ | \texttt\{typewriter\} text | typewriter text |
| $\backslash$ textmd\{ $\langle$ text $\rangle$ \} | \textmd\{medium text | medium text |
| $\backslash$ textbf $\{\langle$ text $\rangle$ \} | $\backslash$ textbf\{bold\} text | bold text |
| $\backslash$ textup $\{\langle$ text $\rangle$ \} | \textup\{upright \} text | upright text |
| $\backslash$ textit $\{\langle$ text $\rangle$ \} | \textit\{italic\} text | italic text |
| $\backslash$ textsl $\{\langle$ text $\rangle$ \} | $\backslash$ textsl\{slanted\} text | slanted text |
| $\backslash \mathrm{textsc}\{\langle$ text $\rangle$ \} | \textsc\{Small Caps\} text | Small Caps text |
| $\backslash \operatorname{emph}\{\langle$ text $\rangle\}$ | $\backslash e m p h\{e m p h a s i z e d\} ~ t e x t$ | emphasized text |
| $\backslash$ textnormal $\{\langle$ text $\dagger\rangle\}$ | \textnormal\{default\} text | default text |

\url\{http://theoval.cmp.uea.ac.uk/~nlct/\}
produces:
http://theoval.cmp.uea.ac.uk/~nlct/
(Note there is no need to do anything with the $\sim$ (tilde) special character if you use it in the argument of \url.)

Environments can be used instead. Each environment has the same name as its corresponding declaration, but without the preceding backslash. For example:
\begin\{sffamily\}Some sans-serif text.\end\{sffamily\} }
yields:
Some sans-serif text.
You can combine a font family with a given shape and weight using a variety of methods.

 Examples:

1 Localised declarations:
$$
\{\backslash s f f a m i l y \backslash s l \text { shape Some slanted sans-serif text.\} }
$$

Table 4.6 Font Changing Declarations

| Declaration | Example Input | Corresponding output <br> (Computer Modern) |
| :--- | :--- | :--- |
| \rmfamily | \rmfamily roman text | roman text |
| \sffamily | \sffamily sans serif text | sans serif text |
| \tffamily | \tffamily typewriter text | typewriter text |
| \mdseries | \mdseries medium text | medium text |
| \bfseries | \bfseries bold text | bold text |
| \upshape | \upshape upright text | upright text |
| \itshape | \itshape italic text | italic text |
| \slshape | \slshape slanted text | slanted text |
| \scshape | \scshape Small Caps text | SmaLL CAPS TEXT |
| \em | \em emphasized text | emphasized text |
| \normalfont | \normalfont default text | default text |

2 Declarations that later get explicitly reset:
\sffamily\slshape Some slanted sans-serif text. $\backslash$ normalfont
3 Mixing text-block and modal commands:
Input
4 Nested commands:

\textsf{\textsl{Some slanted sans-serif text.}}

5 Mixing environments and declarations:

\begin{sffamily}\slshape Some slanted sans-serif
text.\end{sffamily}

All of the above produce the same output:
Some slanted sans-serif text.

Output
[FAQ: Warning:
"Font shape ...
not available"] to be the closest available match.

\section*{Example:}
\textsc\{\bfseries Text\}
With the Antykwa Toruńska typeface, this appears as:
Text
whereas with Computer Modern, the result is:
Text
This is because Computer Modern doesn't have a bold small-caps font, so it just uses bold. ETEX gives the following warning:

LaTeX Font Warning: Font shape 'T1/cmr/b/sc' undefined (Font) using 'T1/cmr/b/n' instead on input line 2792.

Most sans-serif fonts don't provide a small-caps variant, so
\textsf\{\scshape Text\}
will either appear in regular sans-serif or small-caps serif, depending on the font in use. Using Libris sans-serif the result is:

\section*{Text}
whereas using Computer Modern Sans, the result is:
Text

\section*{Emphasizing Words or Phrases}

The command \emph, the declaration \em and the environment em behave slightly differently to the corresponding \textit command, \itshape declaration and itshape environment. The latter group simply use an italic font, whereas the former will toggle between sloping and upright. So if the surrounding font is upright then \(\backslash \mathrm{emph}\), \(\backslash \mathrm{em}\) and em will use the sloping font, but if the surrounding font is italic or slanted, \emph, \em and em will use an upright font. This is particularly useful in abstracts where the abstract font varies between class files. It is recommended that if your intention is to emphasize something, you should use \emph etc. rather than \textit etc.

\section*{Examples:}
1. Emphasized text in upright surrounding:

Some \emph\{emphasized\} text.
Input
yields
Some emphasized text.
Output
2. Emphasized text in italic surrounding:
\{\itshape Some \emph\{emphasized\} text.\}
yields
Some emphasized text.
Output
3. Emphasized text in upright sans-serif surrounding:
\(\{\backslash s f f a m i l y\) Some \emph\{emphasized\} text.\}
yields
Some emphasized text.

\subsection*{4.5.2 Changing the Font Size}

When you start writing a document, you need to decide what the base font size should be. The KOMA-Script classes default to 11 pt , but this can be changed using the class options \(8 \mathrm{pt}, 9 \mathrm{pt}, 10 \mathrm{pt}, 12 \mathrm{pt}, 14 \mathrm{pt}, 17 \mathrm{pt}\) or 20 pt .

You can then change the font size relative to the base size, using one of the declarations shown in Table 4.7. That way, if you later decide to change the normal font size from, say, 11 pt to 12 pt , all you need do is change the class option (see page 76) and re-run ETEX. Note that there are no equivalent text-block commands.

Again, environments can be used instead, where each environment has the same name as its corresponding declaration, but without the preceding backslash. Font environments may be nested, for example:

\begin\{itshape\} Some italic text. \begin\{Large\}This text is }
large. \end\{Large\} \end\{itshape\} Back to normal. }

Output:
Some italic text. This text is large. Back to normal.

4 Creating a Simple Document

Table 4.7 Font Size Changing Declarations

| Declaration | Example Input | Corresponding Output |
| :--- | :--- | :--- |
| \tiny | \tiny tiny text | tiny text |
| \scriptsize | \scriptsize script size | script size |
| \footnotesize | \footnotesize footnote size | footnote size |
| \small | \small small text | small text |
| \normalsize | \normalsize normal size | normal size |
| \large | \large large text | large text |
| \Large | \Large even larger | even larger |
| $\backslash$ LARGE | \LARGE larger still | larger still |
| $\backslash$ huge | \huge huge | huge |
| $\backslash$ Huge | \Huge extra huge | eXtra huge |

 4.5.3 Changing Document Fonts

What if you don't want to use the default Computer Modern fonts? Some publishers and institutions insist on a combination of Times Roman (serif), Helvetica (sans-serif) and Courier (typewriter). To do this, you can load the following packages:
mathptmx (Times) Only affects $\backslash$ rmfamily and $\backslash$ textrm.
helvet (Helvetica) Only affects \sffamily and \textsf.
courier (Courier) Only affects \ttfamily and \texttt.

 Notes:

[FAQ: Choice of scalable outline fonts]

1 Don't be tempted to use the times package. It's obsolete [15]. Use mathptmx instead.
2 Although Times and Helvetica are commonly used together, they don't match, as illustrated below (temporarily switching from this book's fonts to Times and Helvetica):
\rmfamily xx \sffamily xx
Results in:
The first two x 's are in Times Roman and the second two are in Helvetica, which are somewhat larger. To compensate for this you need to scale the Helvetica font using the scaled option:
Loadinghelvetorcourierdoesn'tchangethedefaultfontfamily.Considerthefollowing:\documentclass\{scrartcl\}\usepackage\{helvet\}\begin\{document\}}Thisisasampledocument.\end\{document\}}Here,thetext"Thisisasampledocument"willbetypesetinComputerModernRoman.Thisisbecause\rmfamilyisthedefaultfontandhelvetonlyaffects\sffamily,whichhasn'tbeenused.(SeeSection8.2tofindouthowtochangethedefaultfontfamily.)undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

This book has used the following packages:
kage[T1]\{fontenc\}\usepackage[math]\{anttor\}\usepackage\{libris\}undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

The fontenc package is used to switch to Type 1 font encoding, the anttor package is used to set the serif family to Antykwa Toruńska typeface, and the libris package is used to set the sans-serif family to the Libris ADF typeface.

 Exercise 6 (Fonts)

Go back to the document you created in Exercise 1 and change the first paragraph to a large bold font and the second paragraph to normal size italic. Emphasize the words "simple" and "short". (Again, you can download or view the solution.)

If you like, you can try experimenting with loading different font packages, such as mathptmx, to change the default typeface. The $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Font Catalogue [2] provides a useful list of fonts, although you may not have all of them installed.
[FAQ: Why bother with inputenc and fontenc?]

 4．6 Aligning Material in Rows and Columns

Text can be aligned in rows and columns using the tabular environment．

\begin{tabular}[\langlepos\rangle]{\langlecolumn specifiers\rangle}

This environment has a mandatory argument 〈column specifiers〉 that specifies how to align each column．Within 〈column specifiers〉，there must be a specifier for each column．The three basic are：$r$（right aligned）， 1 （left aligned）and c（centred）．（Make sure you don＇t confuse 1 （the letter ＂ell＂）with 1 （the digit one）．）The optional argument $\langle p o s\rangle$ is covered in Section 4．7．

 Example：

Three columns（left，centred，centred）：
\begin\｛tabular\} \{lcc\}
Another Example：
Four columns（left，centred，centred，right）：
\begin\｛tabular\}\{lccr\}

The $r, l$ and $c$ specifiers don't allow line breaks or paragraphs within a cell. It's not a good idea to have too much text in a cell, but if it's required you can use
$\mathrm{p}\{\langle$ width $\rangle\}$
which indicates a paragraph cell of the given width.

 Example:

Three columns (paragraph of width 1 in , $\underline{\text { centred, right): }}$
\begin\{tabular\}\{p\{1in\}cr\} }
The paragraph cell will be formatted fully justified, which is often inappropriate for a narrow block of text. The array package provides
$>\{\langle$ declaration $\rangle\}$
which can be used directly in front of the $1, \mathrm{c}, \mathrm{r}$ or p column specifiers. This inserts $\langle$ declaration $\rangle$ in front of the entries for that column, so it can be used to insert, say, \raggedright.

 Example:

Three columns, the first left justified where each entry is in bold, the second a paragraph column of width 1 in set to ragged right and the third centered:
\begin\{tabular\}\{>\{\bfseries\}l>\{\raggedright\}p\{1in\}c\} }
The array package also provides
$<\{\langle$ declaration $\rangle\}$
which can be used directly after the $1, \mathrm{c}, \mathrm{r}$ or p column specifiers. This inserts $\langle$ declaration $\rangle$ after the entries for that column.

 Inter-Column Gap:

The gap between columns is given by twice the value of the length register:
\tabcolsep
A gap of \tabcolsep is also inserted before the first column and after the last column. This length can be changed using one of the commands described in Section 2.17. For example:
\setlength\{\tabcolsep\}\{4pt\}

This will put an 8pt gap between columns and a 4 pt gap before the first column and after the last column.

The column specifiers can also include:
@\{〈inter-column text $\rangle\}$
This inserts $\langle$ inter-column text $\rangle$ at that place on each row of the table, replacing the default inter-column gap.

 Example:

Suppose we want a centred first column, a right justified second column and a left justified third column with a dot between the second and third columns:
\begin\{tabular\}\{cr@\{.\}l\} }
Alternatively, you may want a larger gap between groups of columns, for example, two groups of three left justified columns:
\begin\{tabular\}\{lll@\{\hspace\{4\tabcolsep\}\}lll\} }
This uses the command:
\hspace\{〈length $\rangle\}$
which inserts a horizontal space of a given length. In this case, four times the value of $\backslash$ tabcolsep. This makes the gap between the third and fourth columns twice as wide as the gap between the other columns.

 4.6.1 Column and Row Separation

Remember the special characters mentioned in Section 4.3? The ampersand character \& is used to separate column entries. Rows are separated using:

<br>[〈vertical space〉]
 There is also a longer equivalent:
\tabularnewline
If you have used something like $>\{\backslash$ raggedright $\}$ p $\{\langle$ length $\rangle\}$ as the specifier for your last column, you must use \tabularnewline instead of $\backslash \backslash$ to indicate the row break otherwise you will get the following error:
[FAQ: Alignment tab changed to \cr]

! Extra alignment tab has been changed to \cr.
<recently read> \endtemplate

4 Creating a Simple Document

 Example:

Let's have two columns, the first left justified and the second right justified:

\begin{tabular}{lr}
Video & 8.99\\
CD & 9.11\\
DVD & 15.00\\
Total & 33.10
\end{tabular}
\begin{tabular}{lrr|}
\hline Video & 8.99 & \\
CD & 9.11 & Output \\
DVD & 15.00 & \\
Total & 33.10 & \\
& & \(\pm\) output \\
\hline
\end{tabular}

Recall from Chapter 2 (Some Definitions) that \(\mathrm{AT}_{\mathrm{E}} \mathrm{X}\) ignores spaces at the start of a line and treats multiple spaces as a single space, so I could just have easily done:

| Video | 8.99 |
| :--- | ---: |
| CD | 9.11 |
| DVD | 15.00 |
| Total | 33.10 |

and still have got the same result, but now the code is easier to read.
Entries form implicit grouping, so declarations made within a tabular environment only have an effect up to the next \& or \(\backslash \backslash\).

\section*{Example:}

| Video | 8.99 |
| :--- | ---: |
| CD | 9.11 |
| DVD | 15.00 |
| \bfseries Total | 33.10 |

Output:

4 Creating a Simple Document

Let's add an extra column and a header row:

\begin{tabular}{lrr}
Item & ex VAT & inc VAT\\
Video & 8.99 & 10.56 \\
CD & 9.11 & 10.70 \\
DVD & 15.00 & 17.63 \\
\bfseries Total & 33.10 & 39.89
\end{tabular}

Output:

4 Creating a Simple Document
\begin{tabular}{lrr}
\hline & & Inc VAT \\
Item & ex VAT & inc \\
Video & 8.99 & 10.56 \\
Output \\
CD & 9.11 & 10.70 \\
DVD & 15.00 & 17.63 \\
Total & 33.10 & 39.89 \\
& & \\
& & \(\downarrow\) Output \\
\hline
\end{tabular}

\section*{Example (Aligning on a Decimal Point):}

If you want to align on the decimal point, it's best to use the siunitx package. That's beyond the scope of this book, but for simple data this can be achieved using the @ inter-column specifier. For example:

| Video | 8 | 99 |
| :--- | ---: | :--- |
| CD | 9 | 11 |
| DVD | 15 | OO |
| \bfseries Total | 33 | 10 |

Output:

| Video | 8.99 |  |
| :--- | ---: | ---: |
| CD | 9.11 | output |
| DVD | 15.00 |  |
| Total | 33.10 |  |
|  |  | $\downarrow$ Output |

 4.6.2 Spanning Columns

You may have noticed I omitted the column headers in the above example. The problem with rewriting the table using r@\{.\}l to align the decimal point is that the header now needs to span the last two columns. This can be done using the command:
$\backslash$ multicolumn $\{\langle$ cols spanned $\rangle\}\{\langle$ col specifier $\rangle\}\{\langle$ text $t\rangle\}$
[FAQ: Merging
cells in a column of a table]

Definition

The first mandatory argument $\langle$ cols spanned $\rangle$ is the number of columns you want to span, the second argument $\langle\mathrm{col}$ specifier〉 indicates how to align this column-spanning entry, the third argument $\langle$ text $\rangle$ indicates what should go in this entry. Note that $\langle$ col specifier $\rangle$ should only have a single column specifier, such as $\{c\}$ or $\{r\}$. We can use $\backslash$ multicolumn to modify an earlier example as follows:

4 Creating a Simple Document

& \multicolumn{2}{c}{Price (\pounds)}\\
Item & ex VAT & inc VAT\\
Video & 8.99 & 10.56 \\
CD & 9.11 & 10.70 \\
DVD & 15.00 & 17.63 \\
\bfseries Total & 33.10 & 39.89
\end{tabular}

Output:
\begin{tabular}{lrr|r}
\hline & \multicolumn{2}{c|}{ Price (£) } & 个 Output \\
Item & ex VAT & inc VAT & 10.56 \\
Video & 8.99 & 11.74 & \\
CD & 9.99 & 17.63 & \\
DVD & 15.00 & 39.93 & \(\downarrow\) Output \\
Total & 33.98 & & \\
\hline
\end{tabular}

Here we are spanning two columns, so the first argument to \multicolumn is \(\{2\}\), we want the entry centred, so the second argument is \(\{c\}\) and the text to go in this entry is simply \{Price ( \(\backslash\) pounds) \}.

The \(\backslash\) multicolumn command can also be used to override the alignment of individual entries. Consider the following example:

|  | Year1 | Year2 |
| :--- | ---: | ---: |
| Travel | 100,000 | 110,000 |
| Equipment | 50,000 | 60,000 |

Output:
\begin{tabular}{lrr|r|}
\hline & Year1 & Year2 & 个 Output \\
Travel & 100,000 & 110,000 & \\
Equipment & 50,000 & 60,000 & \(\downarrow\) Output \\
\hline
\end{tabular}

In this example, the headers "Year1" and "Year2" would look better centred, but the rest of the entries in the second and third columns look best right
aligned. We can use \multicolumn to span just one column, and use the second argument of \(\backslash\) multicolumn to override the column specification:

\& \multicolumn{1}{c}{Year1}
\& \multicolumn{1}{c}{Year2}<br>
Travel \& 100,000 \& 110,000<br>
Equipment \& 50,000 \& 60,000
\end{tabular}

Output:

|  | Year1 | Year2 |
| :--- | ---: | ---: |
| Travel | 100,000 | 110,000 |
| Equipment | 50,000 | 60,000 |
|  | $\downarrow$ Output |  |
|  |  |  |

 4.6.3 Rules

In general, vertical rules are considered superfluous [11]. Although Turabian [17] allows for the possibility of vertical rules for tabulated material

 4 Creating a Simple Document

containing more than two columns but still advises against having too many and deprecates the use of them at either end.

Horizontal rules may be used at the top and bottom of the tabulated material, but other horizontal rules should be kept to a minimum. In general, the top and bottom rule should be thicker than the mid rules.

The booktabs package provides:
\toprule[ $\langle w d\rangle]$
for the top horizontal rule,
\bottomrule[ $\langle w d\rangle]$
for the bottom horizontal rule, and
$\backslash$ midrule[ $\langle w d\rangle]$
for horizontal rules in between rows, such as after the header row.
These commands should all go at the start of the appropriate row. This means that if you want a bottom rule, you need to add $\backslash \backslash$ followed by \bottomrule at the end of the tabulated material.

 Example:

\begin{tabular}{lrr}
\toprule
& \multicolumn{1}{c}{Year1}
& \multicolumn{1}{c}{Year2}\\
\midrule
Travel & 100,000 & 110,000\\
Equipment & 50,000 & 60,000\\
\bottomrule
\end{tabular}
results in:

The thickness of the top and bottom rule is given by the length register \heavyrulewidth, and the thickness of the mid rule is given by the length
register \lightrulewidth. These rule thicknesses can be overridden using the optional argument \(\langle w d\rangle\) for \(\backslash\) toprule, \(\backslash\) midrule and \(\backslash\) bottomrule.

\section*{Exercise 7 (Aligning Material)}

Go back to the document you created in Exercise 2 (and later modified in Exercise 3), and add the following:
\begin{tabular}{|c|c|c|c|}
\hline \multicolumn{3}{|r|}{Expenditure (£)} & \multirow[t]{3}{*}{¢ Output} \\
\hline & Year1 & Year2 & \\
\hline Travel & 100,000 & 110,000 & \\
\hline Equipment & 50,000 & 60,000 & \\
\hline
\end{tabular}

Note that the tabular environment doesn't create a caption, all it does is arrange its contents in rows and columns. You can find out how to turn your tabular environment into a table in Section 7.2.

You can download or view the solution to this exercise. (Remember to check Appendix B (Common Errors) if you encounter an error message.)

For more information about using the tabular environment see \(E T_{E} X\) : A Document Preparation System [9], A Guide to \(E T_{E}^{X}\) [7] or The \(E T T_{E}^{X}\) Companion [3]. The \(E T T_{E} X\) Companion also describes how to span rows using the multirow package. For information on how to create coloured tables using the colortbl package, see The \({ }^{A T} T_{E} X\) Graphics Companion [5].

\section*{Related UK FAQ [18] topics:}

\subsection*{4.7 Boxes and Mini-Pages}
\(\mathrm{T}_{\mathrm{E}} \mathrm{X}\) views everything on a page as a form of box. Each box has an associated width, height and depth, and the boxes are placed together on the page with glue. This is reminiscent of the days of manual typesetting, where each letter or symbol was on a wooden block, and the wooden
blocks were glued in place. The simplest form of box is a single letter. Some letters, such as "a" only have a height and width, whereas other letters, such as " \(y\) " have a height, width and depth (see Figure 4.3).
height depth

Figure 4.3 TEX Views Each Letter as a Box
For example, the phrase "cabbages and peas" is made up of 15 boxes:

\section*{cabbibages and peals}
whereas the word "cauliflower" consists of 10 boxes: \({ }^{4.2}\)

\section*{cajulifflower}

More complicated boxes are made up of smaller boxes. We have already encountered one of these more complicated boxes: the tabular environment, discussed in the previous section. This type of box is called a horizontal box, which means that it can go in a line of text. For example:

Here is some text.
Here is some text.
A \& B<br>
C \& D
\end{tabular}

The rest of the line.
produces:

[^10]
 Here is some text. $\begin{array}{ll}\text { A } \\ \text { C }\end{array} \quad \begin{aligned} & \text { B } \\ & \text { D }\end{aligned}$ The rest of the line.

Recall from the previous section that the tabular environment had an optional argument $\langle p o s\rangle$. This governs the vertical alignment when the tabular environment occurs within a line of text. This can be one of c (centredthe default, as illustrated above), t (top) and b (bottom). For example,

Here is some text.
\begin{tabular} [b]{cc}
A & B\\
C & D
\end{tabular}
The rest of the line.
produces:

4 Creating a Simple Document

Since a box can't be broken across a line of text, you can use the box making command:
\(\backslash \operatorname{mbox}\{\langle\) text \(\rangle\}\)
to prevent \(\langle\) text \(\rangle\) from spanning a line break.

\section*{Example:}

Compare:
\raggedright Some text at the beginning of a paragraph. Some text in the middle of the paragraph. Some more text. \(\backslash \mathrm{par}\)

Some text at the beginning of a paragraph. Some text in the middle of the paragraph. Some more text.
with:
\(\backslash\) raggedright Some text at the beginning of a paragraph. \(\backslash\) mbox\{Some text in the middle of the paragraph.\} Some more text. \(\backslash\) par

Some text at the beginning of a paragraph.
Some text in the middle of the paragraph. Some more text.
(If \(\backslash\) raggedright had not been used, the text in the \(\backslash\) mbox would've spilt out over the edge of the page.)

Another type of box which can again be placed in a line of text, is the minipage environment.
\(\backslash\) begin \(\{\) minipage \(\}[\langle\) pos \(\rangle][\langle\) height \(\rangle]\{\langle\) width \(\rangle\}\)

As the name suggests, this environment creates a "mini-page" of the given width.

\section*{Example:}

Some text.
$$
\begin{minipage}{2in}
This is a mini-page. The text inside it is formatted as usual.
Paragraph breaks can also be used, but there is no indentation
by default\footnote{and this is how a footnote appears}.
\end{minipage}
$$
The rest of the line.
which produces:

This is a mini-page. The text inside it is formatted as usual.
Some text. Paragraph breaks can also be used, but The rest of the line. there is no indentation by default \({ }^{\text {a }}\).

You can optionally specify a height, and how the mini-page is aligned with the rest of the text. As with the tabular environment, the alignment option \(\langle\) pos \(\rangle\) can be one of t (top), c (centred) or b (bottom). The default is \(c\), which is why the above example has the mini-page centred vertically. This can be changed, for example:

Some text.
\begin\{minipage\}[t]\{2in\} }
This is a mini-page. The text inside it is formatted as usual.
Paragraph breaks can also be used, but there is no indentation by default \(\backslash\) footnote\{and this is how a footnote appears\}. \end\{minipage\} } The rest of the line.
which produces

Some text. This is a mini-page. The text inside it is The rest of the line. formatted as usual.
Paragraph breaks can also be used, but there is no indentation by default \({ }^{\text {a }}\).
\({ }^{a}\) and this is how a footnote appears

Note that the width can be specified relative to the current line width, using the length register \linewidth. For example,
\(\backslash\) begin\{minipage \(\}\) \{ \(0.5 \backslash\) linewidth \(\}\)
will start a mini-page that is half the width of the current line.
There is also a corresponding command
\(\backslash \operatorname{parbox}[\langle\) pos \(\rangle][\langle\) height \(\rangle]\{\langle\) width \(\rangle\}\{\langle\) text \(\rangle\}\)
which behaves in a similar way. So the above example can be rewritten using a \(\backslash\) parbox:

Some text.
\parbox[t]{2in}{This is a parbox. The text inside it is
formatted as usual.
Paragraph breaks can also be used, but there is no indentation
by default.}
The rest of the line.

which produces

Some text. This is a parbox. The text inside it is The rest of the line. formatted as usual.
Paragraph breaks can also be used, but there is no indentation by default.

You may have noticed that the \footnote command has not been used in the above example. The \parbox command is more restricted than the minipage environment, so you can't use the \(\backslash\) footnote command in it. There are also certain environments, such as the list-making environments, that can be used in a minipage but not in a \parbox.

\subsection*{4.7.1 Framed Boxes}

Recall the \(\backslash\) framebox command described in Section 2.8.2:
\(\backslash\) framebox[ \(\langle\) width \(\rangle][\langle\) align \(\rangle]\{\langle\) text \(\rangle\}\)
This treats \(\langle\) text \(\rangle\) as a box of width \(\langle\) width \(\rangle\) and puts a frame around it. The second optional argument may be one of: c (centred contents), l (leftaligned contents), r (right-aligned contents).

\section*{Example:}

Some \framebox[2in]\{framed\} text.
Some framed text.
There is a shorter related command with no optional arguments:
\(\backslash\) fbox \(\{\langle\) text \(\rangle\}\)
The fancybox package provides some additional framing commands:
\(\backslash\) shadowbox \(\{\langle\) text \(\rangle\}\)

4 Creating a Simple Document

Puts a shadow-style frame around its contents:

Some \shadowbox\{framed\} text.
Input

Output
\(\backslash\) doublebox \(\{\langle\) text \(\rangle\}\)
Puts a double-lined frame around its contents:
Some \doublebox\{framed\} text.
Some framed text.
\ovalbox \(\{\langle\) text \(\rangle\}\)
Puts a thin-lined oval frame around its contents:
Some \ovalbox\{framed\} text.
Some framed text.
\(\backslash\) Ovalbox \(\{\langle\) text \(\rangle\}\)
Puts a thick-lined oval frame around its contents:
Some \Ovalbox\{framed\} text.
Some framed text.
If you want a different frame effect, you will need to use a graphical package, such as pgf/tikz.

\section*{Example:}

This example uses commands beyond the scope of this book, but gives you an idea of what's possible.
\documentclass\{scrartcl\}
\usepackage\{tikz\}
\usetikzlibrary\{shapes\}
\usetikzlibrary\{decorations.pathmorphing\}
\begin\{document\} }

4 Creating a Simple Document

Some
$$
\begin{tikzpicture}[baseline=(n.base),decoration=bumps]
\node[draw,ellipse,decorate] (n) {framed};
\end{tikzpicture}
$$
text.
\end{document}

Some \(\underbrace{\text { furul }}_{\text {framed }}\) text.
For further details, see the pgf documentation.

                        8. ?

 5. Structuring Your Document

Let's go back to the document we modified in Exercise 7. In this chapter we shall edit that document step by step until we have a fully-fledged document with title, abstract, table of contents, sections etc.

 5.1 Author and Title Information

The term title page is used to indicate the author, title and date information that can appear either on the front cover by itself or along the top of the first page of text. In order to do this, you must first specify the information. Once this information has been specified it can then be displayed.

The author, title and date are entered using the commands:
\author $\{\langle$ author names $\rangle\}$

\title\{〈title text $\rangle\}$

$\backslash$ date $\{\langle$ document date $\rangle\}$
The KOMA-Script classes also define:

 5 Structuring Your Document

\titlehead\｛〈Title heading〉\}

\subject\｛〈Subject $\rangle\}$
\subtitle\｛〈Subtitle〉\}
$\backslash$ publishers \｛〈Publisher $\rangle\}$
All these title－related commands only store information，they don＇t actu－ ally display anything．These commands can be put in the preamble．With most classes，you will typically need to use at least \author and \title．

Once you have used these commands，you can then display the infor－ mation using the command：
$\backslash$ maketitle
This command should be placed where you want the title page to appear， which is normally at the start of the document environment．

Note that if you don＇t use the \date command，the current date will be inserted．If you want no date to appear，you need to specify an empty argument：
\date\｛\}
［FAQ：The style of document titles］

Multiple authors should be separated by the command \and．For example：

| \author $\{$ A. Jones $\backslash \backslash$ University of Somewhere \and |
| :--- | :--- |
| B. Smith $\backslash$ University of Somewhere Else\} | § Input

 Exercise 8 (Creating Title Pages)

Try editing the document you modified in Exercise 7 to include title information. Modifications are illustrated in bold like this:

5 Structuring Your Document

\documentclass[12pt]{scrartcl}
\usepackage{datetime}
\title{A Simple Document}
\author{Me}
\begin{document}
\maketitle

This is a simple $\backslash$ LaTeX $\backslash \sqcup d o c u m e n t$.
Here is the first paragraph.
Here is the second paragraph $\backslash$ footnote\{with a footnote\}.
As you can see it's a rather short paragraph, but not
as short as the previous one. This document was
created on: \today\」at \currenttime.
\begin\{tabular\}\{lrr\} }
\& \multicolumn\{2\}\{c\}\{\bfseries Expenditure\} $\backslash \backslash$

& \multicolumn{1}{c}{Year1} & \multicolumn{1}{c}{Year2}\\
\bfseries Travel & 100,000 & 110,000\\
\bfseries Equipment & 50,000 & 60,000
\end{tabular}
\end{document}

You can download this document.

 5.2 Abstract

The abstract environment is used to create an abstract for the document. The way in which the abstract is formatted depends on the class file. The scrreprt class file will put the abstract on a page by itself, some class files will indent the abstract and some will typeset the abstract in italic. Note also that some class files (such as scrbook) don't have an abstract environment. Abstracts traditionally go at the start of the document after the title, so the abstract environment should go after the $\backslash$ maketitle command.
[FAQ: 1-column
abstract in
2 -column
document]

 Exercise 9 (Creating an Abstract)

Try editing your document so that it has an abstract: Modifications are illustrated like this:
12pt]\{scrartcl\}\usepackage\{datetime\}undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

\title\{A Simple Document\}

\author\{Me\}
\begin\{document \} }
\maketitle
\begin\{abstract\} }
A brief document to illustrate how to use \LaTeX. \end\{abstract\} }

This is a simple $\backslash$ LaTeX $\backslash_{\bullet}$ document.
Here is the first paragraph.
Here is the second paragraph $\backslash$ footnote\{with a footnote\}.
As you can see it's a rather short paragraph, but not
as short as the previous one. This document was
created on: \today\๖at \currenttime.
\begin\{tabular\}\{lrr\} }
\& $\backslash$ multicolumn $\{2\}\{c\}\{\backslash$ bfseries Expenditure $\} \backslash \backslash$
\& \multicolumn\{1\}\{c\}\{Year1\} \& \multicolumn\{1\}\{c\}\{Year2\}<br>
$\backslash$ ffseries Travel \& $100,000 \& 110,000 \backslash \backslash$
$\backslash$ bfseries Equipment \& 50,000 \& 60,000
\end\{tabular\} }
\end\{document\} }
$\qquad$

You can download this document.

 5．3 Chapters，Sections，Subsections ．．．

Chapters，sections，subsections etc can be inserted using the commands：

\part[\langleshort title\rangle]{\langletitle\rangle}
\chapter[\langleshort title\rangle]{\langletitle\rangle}
\section[\langleshort title\rangle]{\langletitle\rangle}
\subsection[\langleshort tifle\rangle]{\langletitle\rangle}
\subsubsection[\langleshort title\rangle]{\langletitle\rangle}
\paragraph[\langleshort title\rangle]{\langletitle\rangle}
\subparagraph[\langleshort title\rangle]{\langletitle\rangle}
\subsubsection［〈short title〉］\｛〈title〉\}
\paragraph［〈short title \(\rangle]\{\langle\) title \(\rangle\}\)
\subparagraph［〈short title \(\rangle]\{\langle\) title \(\rangle\}\)

All these commands have a moving argument（see Section 2．9），so fragile commands will need to be protected using \protect．The final two com－ mands in the above list，\paragraph and \subparagraph，represent subsub－ subsections and subsubsubsubsections，although most class files typeset their arguments as unnumbered running titles．

Note that the availability of these commands depends on the class file you are using．For example，the scrartcl class file that we have been using is designed for articles，so the \chapter command is not defined in that class，whereas it is defined in the scrreprt and scrbook class files．

Each of the commands above has a mandatory argument $\langle$ title $\rangle$ and an
［FAQ：How to
create a
\subsubsub－
section］

 5 Structuring Your Document

optional argument $\langle$ short title $\rangle$. The mandatory argument $\langle$ title $\rangle$ is simply the title of the chapter/section/subsection etc. For example:

\section{Introduction}

If you are using the scrartcl class file, the output will look like:

 1 Introduction

Note that you don't specify the section number as $\mathrm{ETT}_{\mathrm{E}} \mathrm{X}$ does this automatically. This means that you can insert a new section or chapter or swap sections around or even change a section to a subsection etc, without having to worry about updating all the section numbers.

If you are using a class file that contains chapters as well as sections, the section number will depend on the chapter. So, for example, the current section is the $3^{\text {rd }}$ section of chapter 5 , so the section number is 5.3 . (Note that if you are using a class file where the section number depends on the chapter number, you must have a \chapter command before your first \section command, otherwise your section numbers will come out as 0.1 , 0.2 etc.)

Unnumbered chapters/sections etc are produced by placing an asterisk * after the command name. For example:
\chapter*\{Acknowledgements\}
[FAQ: The style of
section headings]
[FAQ: Why are my sections numbered 0.1 ...?]

Input

 5 Structuring Your Document

You can switch to appendices using the command
\appendix
then continue using \chapter, \section etc. For example (using the scrreprt class file):
\appendix
\chapter\{Derivations\}
Some derivations.
\chapter\{Tables\}
Some tables.

 Note:

The KOMA-Script classes have another type of sectioning command:
$\backslash$ minisec $\{\langle$ heading $\rangle\}$

 5 Structuring Your Document

This provides an unnumbered heading not associated with any of the structuring levels. For example, the above was produce using:

\minisec{Note:}
The KOMA-Script classes have another type of sectioning command:

The next note below was produced using:

\ m i n i s e c \{ I m p o r t a n t ~ N o t e : \}
If you want to change the font style used by headings,
\emph{\bfseries do not} use font declarations in the sectioning
command arguments.

$\qquad$

 Important Note:

If you want to change the font style used by headings, do not use font declarations in the sectioning command arguments. Don't do, for example:
\chapter\{\itshape Introduction\}

The KOMA-Script classes provide the command:
\addtokomafont $\{\langle$ element $\rangle\}\{\langle$ commands $\rangle\}$
where $\langle$ element $\rangle$ is the name of a structuring element (no backslash) and <commands〉 is the list of font changing declarations (see Table 4.6) to apply to that element style. For example, this book uses the commands:

|  | ¢ Input |
| :---: | :---: |
| \addtokomafont \{section\}\{\rmfamily $\backslash$ bfseries\} |  |
| \addtokomafont \{minisec\}\{\rmfamily $\backslash$ bfseries $\backslash$ scshape $\}$ |  |
|  | $\pm$ Input |

 Exercise 10 (Creating Chapters, Sections etc)

Let's try editing our document so that it now has chapters, sections and an appendix. Since the scrartcl class file doesn't have chapters, let's change to the scrreprt class. Changes from our previous document are shown like this.

5 Structuring Your Document

\documentclass[12pt]{scrreprt}
\usepackage{datetime}
\title{A Simple Document}
\author{Me}
\begin{document}
\maketitle
\begin{abstract}
A brief document to illustrate how to use \LaTeX.
\end{abstract}
\chapter{Introduction}
\section{The First Section}
This is a simple \LaTeX\\llcornerdocument.
Here is the first paragraph.
\section{The Next Section}

Here is the second paragraph $\backslash$ footnote\{with a footnote\}.
As you can see it's a rather short paragraph, but not
as short as the previous one. This document was created on: \today\๖at \currenttime.
\chapter\{Another Chapter\}
Here's another very interesting chapter.
We're going to put a picture here later.
\chapter*\{Acknowledgements\}
I would like to acknowledge all those very helpful people who have assisted me in my work.
\appendix
\chapter\{Tables\}
We will turn this tabular environment into a table later.
\begin\{tabular\}\{lrr\} }
\& \multicolumn\{2\}\{c\}\{\bfseries Expenditure\}<br>\}

& \multicolumn{1}{c}{Year1} & \multicolumn{1}{c}{Year2}\\
\bfseries Travel & 100,000 & 110,000\\
\bfseries Equipment & 50,000 & 60,000
\end{tabular}
\end{document}

(You can download a copy of this file if you like, but I recommend that you try editing the file yourself to give you practice.)

 5.4 Creating a Table of Contents

Once you have all your sectioning commands, such as \chapter and \section, you can create a table of contents with the command

\tableofcontents

This command should go where you want your table of contents to appear (usually after \maketitle). The KOMA-Script classes provide two options
that govern the format of the table of contents：toc＝graduated and toc $=f l a t$ ．The first is the default and indents the different sectioning levels． The second doesn＇t use any indentation．

 Example：

\documentclass［12pt，toc＝flat］\｛scrreprt\}
You may recall from the previous section that the sectioning commands all had an optional argument $\langle$ short title〉．If your chapter or section title is particularly long，you can use 〈short title〉 to specify a shorter title that should go in the table of contents．${ }^{5.1}$ The longer title（given by the other argument $\langle$ tifle $\rangle$ ）will still appear in the section heading in the main part of the document．

LETEX processes all source code sequentially，so when it first encoun－ ters the \tableofcontents command，it doesn＇t yet know anything about the chapters，sections etc．So the first time the document is ETEXed the necessary information is written to the table of contents（．toc）file（see Section 2．4）．The subsequent pass reads the information in from the ．toc file，and generates the table of contents．You will therefore need to $\mathrm{EAT}_{E} \mathrm{X}$ your document twice to make sure that the table of contents is up－to－date．
［FAQ：My section title is too wide for the page
header］
［FAQ：Numbers
too large in table of contents，etc］

[^11]
 5 Structuring Your Document

 Adding Extra Information

The starred versions of the sectional commands (such as \chapter*) don't get added to the table of contents. It may be that you want to add it, in which case you need to use
$\backslash$ addcontentsline $\{\langle$ toc $\rangle\}\{\langle$ section unit $\rangle\}\{\langle$ text $\rangle\}$
after the heading. The first argument $\langle t o c\rangle$ is the file extension without the dot. As mentioned above, the table of contents file has the extension .toc, so the first argument should be toc (later in Chapter 7 (Floats), we'll be adding a list of figures and a list of tables, and those have file extensions .lof and .lot, respectively). The second argument $\langle$ section unit $\rangle$ is the name of the section unit. This is just the name of the relevant sectioning command without the backslash. The final argument $\langle$ text $\rangle$ is the entry text. For example (using scrreprt class):

\chapter*{Acknowledgments}
\addcontentsline{toc}{chapter}{Acknowledgements}

\section*{Exercise 11 (Creating a Table of Contents)}

Try modifying your document so that it has a table of contents. Modifications from the previous exercise are illustrated like this:

\documentclass[12pt]{scrreprt}\usepackage{datetime}undefined

 A Simple Document

Me
\begin{document}

\tableofcontents

\begin{abstract}
A brief document to illustrate how to use \LaTeX.

5 Structuring Your Document
\end\{abstract\} }
\chapter\{Introduction\}
\section\{The First Section\}
This is a simple \(\backslash\) LaTe \(X \backslash_{\llcorner }\)document. Here is the first paragraph.
\section\{The Next Section\}
Here is the second paragraph \(\backslash\) footnote\{with a footnote\}.
As you can see it's a rather short paragraph, but not
as short as the previous one. This document was
created on: \today\」at \currenttime.
\chapter\{Another Chapter\}
Here's another very interesting chapter.
We're going to put a picture here later.
\chapter*\{Acknowledgements\}

5 Structuring Your Document
I would like to acknowledge all those very helpful people who have assisted me in my work.
\appendix
\chapter\{Tables\}
We will turn this tabular environment into a table later.

|  | { |  |
| :--- | ---: | ---: |
| bfseries Expenditure} |  |  |
|  | Year1 | Year2 |
| \ \bfseries Travel | 100,000 | 110,000 |
| \bfseries Equipment | 50,000 | 60,000 |

\end\{document\} }
\(\qquad\) ｣

If your table of contents doesn't come out right, try \({ }^{2} T_{E} X\) ing it again. (Again, you can download this file.)

You might want to try experimenting with the toc=flat class options to see what difference it makes:
\documentclass[12pt, toc=flat]\{scrreprt\}

\subsection*{5.5 Cross-Referencing}

We have already seen that ETEX takes care of all the numbering for the chapters etc, but what happens if you want to refer to a chapter or section? There's no point leaving LATEX to automatically generate the section numbers if you have to keep track of them all, and change all your crossreferences every time you add a new section. Fortunately \(\mathrm{IT}_{\mathrm{E}} \mathrm{X}\) provides a way to generate the correct number. All you have to do is label the part of the document you want to reference, and then refer to this label when you want to cross-reference it. \({ }^{\mathrm{ET}} \mathrm{E} \mathrm{X}\) will then determine the correct number that needs to be inserted at that point.

The first part, labelling the place you want to reference, is done using the command:
\(\backslash\) label \(\{\langle\) string \(\rangle\}\)
[FAQ: Referring
to labels in other documents]

\section*{5 Structuring Your Document}

The argument \(\langle\) string \(\rangle\) should be a unique textual label. This label can be anything you like as long as it is unique, but it's a good idea to make it something obvious so that, firstly, you can remember the label when you want to use it, and secondly, when you read through your code at some later date, it's immediately apparent to you to which part of the document you are referring. People tend to have their own conventions for labelling. I usually start the label with two or three letters that signify what type of thing I'm labelling. For example, if I'm labelling a chapter I'll start with ch, if I'm labelling a section I'll start with sec.

\section*{Examples:}
1. Labelling a chapter:

2. Labelling a section:

 Technical Details

\(\backslash l a b e l\{s e c: d e t a i l s\}\)

Note that the \(\backslash\) label command doesn't produce any text, it simply assigns a label. You can now refer to that object using the command:

[\langlestring\rangle](#\langlestring\rangle)

which will produce the relevant number.

\section*{Example:}

See Section \ref\{sec:results\} for an analysis of the results.
It is a typographical convention that you should never start a new line with a number. For example, if you have the text "Chapter 1 " the " 1 " must be on the same line as the "Chapter". We can do this by using an unbreakable space, which will put a space but won't allow \(\mathrm{ET}_{\mathrm{E}} \mathrm{X}\) to break the line at that point. This is done using the tilde ( \(\sim\) ) special character, so the example above should actually be:

\section*{5 Structuring Your Document}

See Section \(\backslash\) ref\{sec:results\} for an analysis of the results.
There is a similar command to reference the page number:
\(\backslash\) pageref\{ \(\{\) string \(\rangle\}\)

\section*{Example:}

See Chapter~[ch:def](#ch:def) on page~\pageref{ch:def} for a list of
definitions.

The label ch:def obviously needs to be defined somewhere:

\chapter{Definitions}
\label{ch:def}
\chapter\{Definitions\}
\label\{ch:def\}

In fact, I have done this in my source code for Chapter 2 (Some Definitions) of this document, so the above example would look like:

See Chapter 2 on page 13 for a list of definitions.

It's not just chapters and sections that you can reference, most of the numbers that ETEX automatically generates can be cross-referenced.
[FAQ: Referring to things by their name]

 Example:

The source code for footnote 5.1 on page 182 is:
$\backslash$ footnote\{ $\backslash$ label $\{\mathrm{ftn}:$ header\}and in the page header, depending on the page style\}
and it was referenced above using:

The source code for footnote $\sim$ reffftn:header $\}$ on page $\sim$ pageref\{ftn:header\} is:

The varioref package provides a more convenient way of doing this using the command:
$\backslash$ vref\{ $\{\langle$ label $\rangle\}$

This is like $\backslash$ ref but also adds information about the location, such as "on page $\langle n\rangle$ " or "on the following page", if the corresponding \label occurs on a different page, so the above example can be changed to:

The source code for footnote~\vref\{ftn:header\} is:
which produces
The source code for footnote 5.1 on page 182 is:

 Caveat:

You can run into trouble if the \vref command occurs on a page break. When it tries to insert the location information, such as "on the next page", the information is no longer correct. This can cause an "Infinite loop" error. When this happens, either edit your paragraph so the reference no longer falls on the page break or use $\backslash$ ref instead of $\backslash v r e f$ for that instance.

 Another Example:

The enumerate environment automatically numbers the items within an ordered list, so it's possible to label list items. Recall the numbered list of instructions at the start of Chapter 3 (From Source Code to Typeset Output). Here's the code:
\begin\{enumerate\} }
                            18. \label\{itm:edit\} Write or edit the source code.
                            19. Pass the source code to the \texttt\{latex\} or \texttt\{pdflatex\} application ('‘ $\backslash$ LaTeX $\backslash_{\perp}$ the document'’).
\begin\{itemize\} }
                            20. If there are any error messages, return to Step~ $\backslash$ ref\{itm:edit $\}$.
                            21. If there are no error messages, a PDF file is created, go to Step~\ref\{itm:view\}.
\end\{itemize\} }
                        9. \label\{itm:view\} View the PDF file to check the result.
\end\{enumerate\} }

Output:

1 Write or edit the source code.
2 Pass the source code to the latex or pdflatex application ("IATEX the document").
1 If there are any error messages, return to Step 1.
2 If there are no error messages, a PDF file is created, go to Step 3.

3 View the PDF file to check the result.
The $\backslash r e f$ and $\backslash$ pageref commands may come before or after the corresponding \label command. As with the table of contents, LATEX first writes out all the cross-referencing information to another file (the auxiliary (.aux) file, see Section 2.4) and then reads it in the next time, so you will need to ${ }^{E} T_{E} \mathrm{X}$ your document twice to get everything up-to-date.

If the references aren't up-to-date, you will see the following message at the end of the $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ run:

 5 Structuring Your Document

LaTeX Warning: Label(s) may have changed.
Rerun to get cross-references right.
The following warning
LaTeX Warning: There were undefined references.
means that $\operatorname{AT}$ EX found a reference to a label that does not appear in the auxiliary file. This could mean that it's a new label, and the warning will go away the next time you LATEX your document, or it could mean that either you've forgotten to define your label with the \label command, or you've simply misspelt the label. The undefined references will show up as two question marks ?? in the output file.

Very occasionally, if you have cross-references and a table of contents, you might have to $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ your document three times to get everything up to date. Just check to see if the Label(s) may have changed warning appears.

If you find it inconvenient having to remember to click the typeset button twice, you can use latexmk. This will run ETEX the required number of times to ensure the document is up-to-date. To do this in TeXWorks, change the drop-down menu to "LaTeXmk", as illustrated in Figure 5.1. Note that latexmk is a Perl script, so you need to make sure you have perl installed (see Section 2.20).

If latexmk isn't listed in the drop-down menu, you can add it via Edit $\rightarrow$ Preferences. This opens the dialog box shown in Figure 5.2. You can add a

Figure 5.1 Selecting LaTeXmk in TeXWorks
new tool as follows:

1 To the right of the box labelled "Processing Tools" there is a button marked with a plus (+) sign. Click on it to open the tool configuration dialog, shown in Figure 5.3.
2 Fill in the name "LaTeXmk" in the box labelled "Name" and either type in the location of latexmk in the box labelled "Program" or use the "Browse" button to locate it on your filing system. (See Figure 5.4.) This will vary depending on your operating system and TEX-distribution, but it will probably be in a subdirectory (folder) called bin somewhere in the $\mathrm{T}_{\mathrm{E}} \mathrm{X}$-distribution tree.
3 There are lots of options that can be passed to latexmk, but if you want to produce PDF output you need to add -pdf as an argument. This is done by clicking on the button marked with a plus to the right of the "Arguments" box and type -pdf, as shown in Figure 5.5.
4 Another argument needs to be added that specifies the basename of the $E T_{E X}$ file. This is done by again clicking on the plus button and typing \$basename, as shown in Figure 5.6 .
5 Click on "OK" to close the Tool Configuration dialog.
6 If you want to set latexmk to be your default processing tool, you can select it from the drop-down list labelled "Default".
7 Click "OK" when you're done.

 Exercise 12 (Cross-Referencing)

Try modifying your code so that it has cross-references. Again, changes made from the previous exercise are illustrated like this:

\subsection*{5.6 Creating a Bibliography}

If you have a large number of citations in your document, it's best to use an external bibliographic application, such as bibtex or biber. However, that is beyond the scope of this book (see, instead, A Guide to \(E A T_{E}^{X}\) [7], The \(E A T_{E} X\) Companion [3] or Using \(L A T_{E} X\) to Write a PhD Thesis [13]).
[FAQ: Creating a BibTeX
bibliography file]

\section*{5 Structuring Your Document}
environment, which is usually automatically generated using bibtex or biber.
\begin\{thebibliography\} \{〈widest tag } \rangle \}
This environment is very similar to the list making environments described in Section 4.4, but instead of

                        10. use
$\backslash$ bibitem $[\langle$ tag $\rangle]\{\langle$ key $\rangle\}$
where $\langle$ key $\rangle$ is a unique keyword that identifies this item. Your keyword can be anything you like, but as with \label I recommend that you use a short memorable keyword. I tend to use the first author's surname followed by the year of publication.

The bibliography heading depends on the class file you are using. Most of the article-style classes, such as scrreprt, use $\backslash$ refname (which produces "References") in an unnumbered section, whereas the report and bookstyles, such as scrreprt and scrbook, use \bibname (which produces "Bibliography") in an unnumbered chapter. See Table 8.1 for the list of the common textual label commands.

Most class files don't automatically add the bibliography to the table of contents. The KOMA-Script classes provide the bibliography option.

 5 Structuring Your Document

This can be bibliography=totoc (an unnumbered unit added to the table of contents), for example,
\documentclass[bibliography=totoc] \{scrreprt\}
or bibliography=totocnumbered (a numbered unit added to the table of contents), for example,
\documentclass[bibliography=totocnumbered]\{scrreprt\}
If you're not using one of the KOMA-Script classes, consult the documentation for your class to see if there is an equivalent option. Failing that, you can use \addcontentsline (described in Section 5.4). For example (using a class that defines chapters):
\addcontentsline\{toc\} \{chapter\}\{\bibname\}
\begin\{bibliography\}\{1\} }

 Example:

(This example uses the command $\backslash$ LaTeXe which produces the $\operatorname{ET}_{E} X 2_{\varepsilon}$ logo. This indicates the current version of ETEX rather than the old 2.09

 5 Structuring Your Document

version. $)^{5.2}$ The class style in use is scrbook, so the title is given by $\backslash$ bibname ("Bibliography").

$$
\text { \begin\{thebibliography\}\{3\} }}
$$

\bibitem\{lamport94\} '‘\LaTeX: a document preparation system’’, Leslie Lamport, 2nd edition (updated for \LaTeXe), Addison-Wesley (1994).
\bibitem\{kopka95\} '‘A Guide to \LaTeX: document preparation for beginners and advanced users', Helmut Kopka and Patrick W. Daly, Addison-Wesley (1995).
\bibitem\{goossens94\} '‘The \LaTeX\」Companion’’, Michel Goossens, Frank Mittelbach and Alexander Samarin, Addison-Wesley, (1994).
\end\{thebibliography\} }

[^12]
 Bibliography

[1] "ETEX: a document preparation system", Leslie Lamport, 2nd edition (updated for $\mathrm{ET}_{\mathrm{E}} \mathrm{X} 2 \varepsilon$ ), Addison-Wesley (1994).
[2] "A Guide to $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ : document preparation for beginners and advanced users", Helmut Kopka and Patrick W. Daly, Addison-Wesley (1995).
[3] "The ETTEX Companion", Michel Goossens, Frank Mittelbach and Alexander Samarin, Addison-Wesley, (1994).
$\qquad$ $\downarrow$ Output
You can cite an item in your bibliography with the command
$\backslash$ cite $[\langle$ text $\rangle\rangle]\{\langle$ key list $\rangle\}$

 Example:

5 Structuring Your Document

For more information about writing bibliographies see Goossens \emph\{et al.\}~\cite\{goossens94\}.

Output:
For more information about writing bibliographies see Goossens et al. [3].

If you want to cite multiple works, use a comma-separated list:

For more information about writing bibliographies see~\cite\{kopka95, goossens94\}.

Output:
For more information about writing bibliographies see $[2,3]$.
The optional argument $\langle$ text $\rangle$ to the $\backslash$ cite command can be used to add text to the citation.

 Example：

$\square$
Output：
For more information about writing bibliographies see Goossens \emph\｛et al．\}~\cite[Chapter~13]\{goossens94\}.

For more information about writing bibliographies see Goossens et
〒 Output al．［3，Chapter 13］．

The thebibliography environment has a mandatory argument：
\begin\｛thebibliography\} \{ $\langle$ widest tag $\rangle\}$
The argument 〈widest tag〉 is the widest tag in the list of entries．This helps $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ to align the references correctly．In the example above，the tags appeared as：［1］，［2］and［3］，and［3］is the widest so that was used as the argument．These tags can be changed from the default numbers to something else using the optional argument to the \bibitem command．

 5 Structuring Your Document

 Example (Textual Tags):

This example uses the optional argument of $\backslash$ bibitem to use textual rather than numerical tags. The widest tag is [Goossens 1994] so that is chosen to be the argument of the thebibliography environment:
\begin\{thebibliography\}\{Goossens 1994\} }
\bibitem[Lamport 1994]\{lamport94\} '‘ $\backslash$ LaTeX $\backslash$ : a document preparation system'’, Leslie Lamport, 2nd edition (updated for \LaTeXe), Addison-Wesley (1994).
\bibitem[Kopka 1995]\{kopka95\} '‘A Guide to \LaTeX: document preparation for beginners and advanced users'', Helmut Kopka and Patrick W. Daly, Addison-Wesley (1995).
\bibitem[Goossens 1994]\{goossens94\} '‘The \LaTeX $\backslash \_$Companion'’, Michel Goossens, Frank Mittelbach and Alexander Samarin, Addison-Wesley, (1994).
\end\{thebibliography\} }

 Bibliography

[Lamport 1994] "EATEX : a document preparation system", Leslie Lamport, 2nd edition (updated for $\mathrm{ET}_{\mathrm{E}} \mathrm{X} 2 \varepsilon$ ), Addison-Wesley (1994).
[Kopka 1995] "A Guide to $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ : document preparation for beginners and advanced users", Helmut Kopka and Patrick W. Daly, Addison-Wesley (1995).
[Goossens 1994] "The ETEX Companion", Michel Goossens, Frank Mittelbach and Alexander Samarin, Addison-Wesley, (1994).
$\qquad$

 Exercise 13 (Creating a Bibliography)

Try adding the following chapter to your document:
\chapter\{Recommended Reading\}
For a basic introduction to $\backslash \mathrm{LaTeX} \backslash_{\lrcorner}$see
Lamport~\cite\{lamport94\}. For more detailed information about
$\backslash$ LaTeX $\backslash_{\llcorner a n d ~}$ associated applications, consult Kopka and Daly~\cite\{kopka95\} or Goossens \emph\{et al\}~\cite\{goossens94\}.
and also add the bibliography shown above to the end of your document. You can download or view the solution, but have a go by yourself first. Remember that, as before, you will need to $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ the document twice to get the references up-to-date, unless you're using latexmk (as described in Section 5.5) in which case it will be done automatically.

 5.7 Page Styles and Page Numbering

You may have noticed that the documents you have created have all had their page numbers automatically inserted at the foot of most of the pages. If you have created the document that has gradually been modified over the previous few sections, you may have noticed that the title page has no header or footer, the table of contents starts on page 1, the abstract page has no page number, and the pages after the abstract start on page 1 and continue incrementally onwards from that point. All the page numbers are Arabic numerals. This can be changed using the command:
$\backslash$ pagenumbering\{〈style〉\}
[FAQ: Page
numbering " $\langle n\rangle$ of $\langle m\rangle "]$

 5 Structuring Your Document

where $\langle$ style $\rangle$ can be one of:
arabic Arabic numerals ( $1,2,3, \ldots$ )
roman Lower case Roman numerals (i, ii, iii, ...)
Roman Upper case Roman numerals (I, II, III, ...)
alph Lower case alphabetical characters (a, b, c, ...)
Alph Upper case alphabetical characters (A, B, C, ...)
Traditionally, the front matter (table of contents, list of figures etc) should have lower case Roman numeral page numbering, while the main matter should be in Arabic numerals.

Example:
\author \{Me\}

\title\{A Simple Document\}

$\backslash$ maketitle
\pagenumbering\{roman\}

5 Structuring Your Document
\tableofcontents
\begin\{abstract \} }
This is the abstract.
\end\{abstract \} }
$\backslash$ pagenumbering\{arabic\}
\chapter\{Introduction\}

The scrbook class provides:
$\backslash$ frontmatter
which switches to lower case Roman numeral page numbering, and
$\backslash$ mainmatter
which switches to Arabic numeral page numbering. These two declarations also change the way the sectioning units, such as \chapter and \section, appear. The former, $\backslash f r o n t m a t t e r, ~ s u p p r e s s e s ~ t h e ~ n u m b e r i n g ~(r e g a r d-~$ less of whether or not you've used the starred version of the sectioning

 5 Structuring Your Document

commands). The latter, \mainmatter, switches the numbering back on (unless otherwise suppressed by using the starred sectioning commands). In addition, scrbook provides
$\backslash$ backmatter
which doesn't affect the page numbering but, like $\backslash$ frontmatter, suppresses the sectional unit numbering.

 Note:

The abstract environment isn't defined by the scrbook class, as a book summary is usually incorporated into an introductory section.

 Example:

\documentclass[12pt]{scrbook}
\title{A Simple Document}
\author{Me}
\begin{document}
\maketitle

5 Structuring Your Document

\rontmatter
\tableofcontents
\chapter{Summary}
A brief document to
illustrate how to use \LaTeX.
\mainmatter
\chapter{Introduction}
\label{ch:intro}
\end{document}

The headers and footers can be changed using the command
\pagestyle\｛〈style $\rangle\}$
Individual pages can be changed using
\thispagestyle\｛〈style〉\}

5 Structuring Your Document

Standard styles are:
empty No header or footer.
plain Header empty, page number in footer.
headings Header contains page number and various information, footer empty.
myheadings Header specified by user, footer empty.
If the myheadings style is used, the header information can be specified using:
$\backslash$ markboth $\{\langle$ left head $\rangle\}\{\langle$ right head $\rangle\}$
if the twoside option has been passed to the class file (default for scrbook), or
$\backslash$ markright $\{\langle$ right head $\rangle\}$
if the oneside option has been passed to the class file (default for scrartcl and scrreprt).

The scrreprt class file uses the empty style for the title and abstract pages and plain for the first page of each new chapter. By default the remaining pages are also plain, but these can be changed using the $\backslash$ pagestyle command. The scrbook class defaults to the headings style instead of plain.

The KOMA-Script bundle provides a way to define new page styles, but that's beyond the scope of this introductory tutorial. See the KOMA-Script documentation for further details if you are interested.

This screen version of the book uses a page style I defined myself that incorporates a navigation bar in the footer. The A4 version mostly uses the headings page style. If you look at it, you will see that the chapter number and title appear on the top left and the page number appears in the top right of most pages. The oneside option was used, so there is no difference between the formatting of odd and even numbered pages. Whereas the paperback version uses the twoside option so the odd and even page headers are different.

 Exercise 14 (Page Styles and Page Numbering)

Try modifying your code so that it uses the scrbook class, $\backslash$ frontmatter and \mainmatter. Replace the abstract environment with an unnumbered chapter, as shown below. Again, changes made from the previous document are illustrated like this:
[FAQ: Alternative head- and footlines in
LaTeX]

5 Structuring Your Document

\documentclass[12pt]{scrbook}
\usepackage{datetime}
\pagestyle{headings}
\title{A Simple Document}

\chapter{Summary}
A brief document to
illustrate how to use \LaTeX.

5 Structuring Your Document

\mainmatter
\chapter{Introduction}
\label{ch:intro}
\section{The First Section}
This is a simple \LaTeX\\llcornerdocument.
Here is the first paragraph.
The next chapter is Chapter~\ref{ch:another}
and is on page~\pageref{ch:another}.
The next section is Section~\ref{sec:next}.
% Rest of document unchanged but
% omitted for brevity.
\end{document}

$\llcorner\downarrow \downarrow$ Code
(You can download or view the edited document.)

 5.8 Multi-Lingual Support: using the babel package

You may have noticed that the ofcontentsand\chaptercommandshaveproducedEnglishwordslike"Contents"and"Chapter".Ifyouarewritinginanotherlanguage,thisisnotappropriate.Inthiscase,youcanusethebabelpackage,andspecifywhichlanguageyouwillbeusing,eitherasanoptiontothebabelpackage,orasanoptiontotheclassfile.Ifyouarewritinginmorethanonelanguage,listallthelanguagesthatyouwillbeusingwherethelastnamedlanguageisthedefaultlanguage.Forexample:\usepackage[english,french]\{babel\}or\documentclass[english,french]\{scrreprt\}\usepackage\{babel\}Youcanthenswitchbetweenthenamedlanguageseitherusingthedeclaration:\selectlanguage$\{\langle$language$\rangle\}$[FAQ:HowtochangeLaTeX's"fixednames"][FAQ:Usinganewlanguagewithortheotherlanguageenvironment:undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

These will affect all translations, including the date format and predefined names like "Chapter". This also changes the hyphenation patterns. (See Section 2.14.)

If you only want to set a short section of text in a different language, without affecting the date format or predefined names, then you can either use the command:
$\backslash$ foreignlanguage $\{\langle$ language $\rangle\}\{\langle$ text $\rangle\}$
or the starred version of the otherlanguage environment:
\begin\{otherlanguage*\} \{〈language } \rangle \}
You can test to see if a given language is currently selected using:
$\backslash i f l a n g u a g e\{\langle$ language $\rangle\}\{\langle$ true text $t\rangle\}\{\langle$ false text $\rangle\}$

5 Structuring Your Document

 Example:

documentclass[UKenglish,USenglish,french]{scrartcl}
% french is the last named option, so that's the current language
\usepackage[T1]{fontenc}
\usepackage[utf8]{inputenc}
\usepackage{babel}
\begin{document}
Ce texte est en fran\c{c}ais. La date aujourd'hui est: \today.
\selectlanguage{USenglish}
This text is in US English. Today's date is: \today.
\selectlanguage{UKenglish}
This text is in UK English. Today's date is: \today.
\end{document}

Result:

Ce texte est en français. La date aujourd'hui est : 25 septembre 2012. This text is in US English. Today's date is: September 25, 2012. This text is in UK English. Today's date is: 25th September 2012.

 Note:

If you are using the french option, the colon character (:) is made active (that is, it's turned into a special character) so if you are writing in French it's best not to use a colon in labels (so where I've used, say, ch: def you may need to change the colon to something else).

 6. The graphicx Package

It is possible to generate images using $\mathrm{ETEX}_{\mathrm{E}}$ commands (See the $\mathrm{pg} /$ /tikz package or The $A T_{E} X$ Graphics Companion [5]) however most people find it easier to create a picture in some other application, and include that file into their $E T E X$ document.

PDFEATEX can insert PDF, PNG and JPG image files into your document. If your image file is in a different format, you may be able to find an application to convert it. Modern $\mathrm{T}_{\mathrm{E}} \mathrm{X}$-distributions can automatically convert EPS files to PDF during the ETEX run using the Perl script epstopdf. If your TEX-distribution doesn't support this, you can convert your EPS
[FAQ: Drawing with TeX]
[FAQ: Spawning programs from
(La)TeX:
\write18] file using epstopdf explicitly. For example, if you have an EPS image called, say, sample-image.eps, you can convert it to a PDF image called sample-image.pdf, by using the following command in a terminal or command prompt:
epstopdf sample-image.eps
or (full path name may be required)
perl epstopdf sample-image.eps

6 The graphicx Package
To insert an image file into your document, you first need to specify that you want to use the graphicx package. So the following must go in the preamble:
nthenbeincludedinyourdocumentusingthecommandfilename(%5Crangle%5C)\)where$\langle$filename$\rangle$isthenameofyourimagefilewithoutthefileextension,and$\langlekey$-valoptions$\rangle$isacomma-separatedlistofoptionsthatcanbeusedtochangethewaytheimageisdisplayed.Notethatifyouhaveanimagewherethefilenamecontainspacesormultipledots,youneedtousethegrffilepackage:\usepackage\{graphicx,grffile\}undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

 Example:

Suppose you had a file called shapes.pdf, then to include it in your document you would do:

[FAQ: "Modern"
graphics file names]
which would produce:

6 The graphicx Package

You can specify a full or relative pathname, but you must use a forward slash / as the directory divider, even if you are using Windows. For example:

means the file pictures/shapes.pdf on Unix-type systems, and it means the file pictures $\backslash$ shapes.pdf on Windows. ${ }^{6.1}$ This is mainly because the

[^13]6 The graphicx Package
backslash character is a ET EX special character indicating a command, but it also helps portability between platforms.

You can specify the order of the file types to look for with the command
$\backslash$ DeclareGraphicsExtensions $\{\langle$ ext-list $\rangle\}$
where $\langle$ ext-list $\rangle$ is a comma-separated list of extensions. For example, you might want to search first for PDF files, then for PNG files, then for JPG files and finally for EPS files:
\DeclareGraphicsExtensions\{.pdf,.png,.jpg,.eps\}
The default for PDFETEX is:
.png,.pdf,.jpg,.mps,.jpeg,.jbig2,.jb2,.PNG,.PDF,.JPG,.JPEG, .JBIG2,.JB2,.eps

The optional argument $\langle k e y$-val options〉 should be a comma-separated list of $\langle$ key $\rangle=\langle$ value $\rangle$ pairs. Common options are:
angle $=\langle x\rangle \quad$ rotate the image by $x^{\circ}$ anticlockwise.
width=$=\langle$ length $\rangle \quad$ scale the image so that the width is $\langle$ length $\rangle$. (Remember to specify the units.)

6 The graphicx Package
height $=\langle$ length $\rangle \quad$ scale the image so that the height is $\langle$ length $\rangle$. (Remember to specify the units.)
scale $=\langle$ value $\rangle \quad$ Scale the image by $\langle$ value $\rangle$
trim $=\langle l\rangle\langle b\rangle\langle r\rangle\langle t\rangle$ Specifies the amount to remove from each side. For example

crops the image by 1 bp from the left, 2 bp from the bottom, 3 bp from the right and 4 bp from the top. (Recall the bp unit from Table 2.1.)
draft Don't actually print the image, just draw a box of the same size and print the filename inside it.

 Example:

This example first rotates the image by $45^{\circ}$ anticlockwise, then scales it so that the width is 1 inch.

6 The graphicx Package

Note that this isn't the same as scaling and then rotating: 

You can also scale an image relative to the text area using the length registers \textwidth and \textheight. For example, to scale a portrait

6 The graphicx Package
image so that its height is three-quarters of the text area height, you can do:

or to scale a landscape image so that its width is half the text area width, you can do:

Note:
The \includegraphics command is another form of box (see Section 4.7), and can be used in the middle of a line of text, just like the tabular environment. See Section 7.1 to find out how to put the image in a figure with a caption.

 Example:

Recall the ex unit of measure from Table 2.1. This can be used to scale an image relative to the font size:

An image can be inserted into a line of text like this:
\includegraphics[height=2ex]{shapes}

6 The graphicx Package

An image can be inserted into a line of text like this：

\section*{6．1 Graphical Transformations}

The graphicx package also provides commands to rotate，resize，reflect and scale text．They are as follows：
\(\backslash\) rotatebox［ \(\langle\) option list \(\rangle]\{\langle\) angle \(\rangle\}\{\langle\) tex \(t\rangle\}\)
Rotates \(\langle\) text \(\rangle\) by \(\langle\) angle \(\rangle\)（degrees anti－clockwise by default）．The optional argument \(\langle\) option list \(\rangle\) is a comma－separated list of any of the following options：
－units＝〈number〉
The number of units in one full anti－clockwise rotation．So units＝－360 means that \(\langle\) angle〉 specifies degrees clockwise whereas units＝6．283185 means that \(\langle\) angle \(\rangle\) is in radians．
－origin＝〈label \(\rangle\)
The point of rotation．The value \(\langle\) label \(\rangle\) may contain one from either or both of the two lists：lrc（left，right，centre）and tbB（top，

6 The graphicx Package
bottom, baseline). Alternatively the origin may be specified using the following two keys:
- \(\mathrm{x}=\langle\) dimen \(\rangle\)
- \(\mathrm{y}=\langle\) dimen \(\rangle\)

\section*{Example:}
base line
\(\backslash\) rotatebox\{45\}\{Some text \}
\rotatebox[units=-360]\{45\}\{Some text\}
\(\backslash\) rotatebox[units=-360, origin=rB]\{45\}\{Some text\}
\(\backslash\) rotatebox[x=3em, \(y=3 \mathrm{em}]\{45\}\{\) Some text \}
base line

6 The graphicx Package

\scalebox{\langleh scale\rangle}[\langlev scale\rangle]{\langletext\rangle}

Scales \(\langle\) text \(\rangle\) by \(\langle h\) scale \(\rangle\) in both directions if \(\langle v\) scale \(\rangle\) omitted, otherwise scales \(\langle\) text \(\rangle\) by \(\langle h\) scale \(\rangle\) horizontally and \(\langle y\) scale \(\rangle\) vertically.

\section*{Example:}
\scalebox\{0.8\}\{Some text\}

Some text
Compare with:
\scalebox\{0.8\}[1.2]\{Some text\}
Some text

Output

Input

Output

6 The graphicx Package
\(\backslash\) reflectbox \(\{\langle\) tex \(t\rangle\}\)
Reflects \(\langle\) text \(\rangle\) (equivalent to \scalebox \(\{-1\}[1]\{\langle\) text \(\rangle\}\) ).

\section*{Example:}
\(\backslash\) reflectbox\{Some text\}
Input
tx9t 9mo己
Output
\(\backslash\) resizebox \(\{\langle h\) length \(\rangle\}\{\langle\nu\) length \(\rangle\}\{\langle\) text \(\rangle\}\)
Scales \(\langle\) text \(\rangle\) so that it is \(\langle h\) length \(\rangle\) wide and \(\langle v\) length \(\rangle\) high. To preserve the aspect ratio, use ! instead of one of the dimensions.

\section*{Example:}

\resizebox{12mm}{1cm}{Some text}
\resizebox{!}{1cm}{Some text}

\section*{Smpetifome text}

\subsection*{6.2 Package Options}

The graphicx package can have the following options passed to it:
draft Don't actually display the images, just print the filename in a box of the correct size. This is useful if you want to print out a draft copy of a document to check the text rather than the images.
final Opposite of draft (default).
hiderotate Don't show rotated text.
hidescale Don't show scaled text.
Remember that relevant options passed to the class file also affect packages.

6 The graphicx Package

\section*{Example (Draft Mode):}

Draft mode helps to speed up compilation of a large document when you are editing the text. In the preamble:
\usepackage[draft]\{graphicx\}
or
\(\square\)
\documentclass[draft]\{scrbook\}
\usepackage\{graphicx\}

Later in the document:
\includegraphics[width=1in, angle=45] \{pictures/shapes\}

6 The graphicx Package

\section*{Exercise 15 (Using the graphicx Package)}

Download the image file shapes.pdf from http://www.dickimaw-books. com/latex/novices/html/exercises/ (or create your own image), and include it into your document. (You can download or view an example solution.)

6 The graphicx Package
For more information on the graphicx package see The \({ }^{A} T_{E} X\) Graphics Companion [5] or the graphicx documentation.

\section*{7. Floats}

Figures and tables are referred to as "floats" because they are floated to the nearest location. This prevents ugly large spaces appearing on the page if there isn't enough room for the figure or table before the page break. Floats have a caption and associated number. It is customary for captions to appear at the bottom of figures but at the top of tables [17, 11].

For both figures and tables, the caption is generated using the command:
\caption[〈short caption \(\rangle]\{\langle\) text \(\rangle\}\)
Note that the \caption command has a moving argument, so fragile commands will need to be protected using \(\backslash\) protect. The optional argument〈short caption \(\rangle\) is used to provide an alternative shorter caption for the list
[FAQ: The style of captions]

Definition
[FAQ: Footnotes in captions] of figures or list of tables, akin to the optional argument to the sectioning commands.

\section*{7 Floats}

\section*{Note:}

Although the \caption command can have an optional short title, in general, captions should be brief. They should not contain lots of description or background detail [17]. That type of information should be placed in the main text not the caption.

\section*{Positioning:}

Both the figure and table environments have an optional argument \(\langle\) placement specifiers), which indicates permissible locations for the float. This may be a combination of \(h\) ("here"), \(t\) (top), b (bottom) and p (page of floats.) Note that this only gives a general guideline as to where the float will end up. The final location is governed by other factors, such as space left on the page and the proportion of text to floats on the page. If you omit one or more of the placement specifiers, then you are prohibiting the float from being placed in that location. A common mistake is to do

\section*{\begin\{figure\}[h] }}
which says "I want the figure here and it can't go anywhere else!" If the figure can't be placed exactly here (for example, there may not be enough room on the page), then you have given it no alternative location, which can result in this and all subsequent figures being dumped at the end of the chapter or document, or can result in a fatal error when running LATEX. You may be able to manage with only one of the other options, for example,
[FAQ: Wide
figures in
two-column
documents]

\section*{7 Floats}
\begin\{figure\}[t] }
(In fact, modern \(T_{E X}\) distributions now replace [h] with [t] if the float can't be placed.) However, if you have a large number of floats it is advisable to provide as many options as possible:
\begin\{figure\} [htbp] }
Similarly for tables.
If you are absolutely adamant that an image must go "right here", then it's not a float, and you shouldn't be using the figure environment. It's just a horizontal box, like the example on page 234. Similarly for tabulated material.

It's worth bearing in mind what the Oxford Style Manual [11] has to say:
"Text must not be read into it so as to give [the figure] an explicit and fixed introduction, for example 'in the following figure': the final placement is determined by page breaks, which cannot be anticipated before setting, and this makes rewording the text necessary if the illustration does not fit the make-up of the page."

Turabian [17] gives the same advice (and reiterates it for figures):
"All text references to a table should be by a number, not by an introductory phrase such as 'in the following table'."

\subsection*{7.1 Figures}

Figures are created using the figure environment.

[\langleplacement specifiers\rangle]
```
This environment may contain one or more captions (specified, as described above, with the \caption command) but page breaks are not allowed in the contents of a figure environment. The optional argument〈placement specifiers〉 is as described above.
Recall from Chapter 6 (The graphicx Package) that we can include an image in our document with the command [htbp]

```\caption\{Some Shapes\} \end\{figure\} } So far so good, but our picture needs to be centred. This can be done using the  declaration mentioned in Section 2.12:```
\begin{figure}[htbp]

Some Shapes

The \caption command generates a number, just like $\backslash$ section, so we can cross-reference it with $\backslash$ ref and $\backslash$ label. First, let's label the figure:

\begin{figure} [htbp]
\centering
\includegraphics{shapes}
\caption{Some Shapes}
\label{fig:shapes}
\end{figure}

\section*{7 Floats}

Now we can reference it:
Figure \(\backslash\) ref\{fig:shapes \(\}\) shows some shapes.
(As before we use \(\sim\) to make an unbreakable space.) This produces the following output in the text:

Figure 7.1 shows some shapes.
and produces Figure 7.1.

\section*{Important Note:}

If you want to change the caption font, don't do, e.g.:
\caption\{\bfseries Some Shapes\}
Recall \addtokomafont from Section 5.3. This can also be used to change the fonts used by the caption.
\addtokomafont \{caption\}\{\bfseries\}
Similarly for the caption label. For example:
\addtokomafont \{captionlabel\}\{\scshape\}

\section*{7 Floats}

Figure 7.1 Some Shapes

\section*{7 Floats}

\section*{List of Figures}

Just as we were able to generate a table of contents using \tableofcontents, we can also generate a list of figures using the command
\listoffigures
This creates a file with the extension .lof (see Section 2.4). As with \tableofcontents you will need to \(\mathrm{ET}_{\mathrm{E}} \mathrm{X}\) your document twice to get the list of figures up-to-date, unless you're using latexmk (as described in Section 5.5 ) in which case it will be done automatically.

\section*{Exercise 16 (Creating Figures)}

If you did Exercise 15, you should have a document with an image in it. You now need to put this image into a figure environment. Remember to centre the image, and give the figure a caption. Next, try labelling the figure and referencing it in the text. You could also put in a list of figures after the table of contents. You can download or view an example.

\section*{7 Floats}

\subsection*{7.1.1 Side-By-Side Figures}

Recall at the start of Section 7.1, I mentioned that the figure environment may contain one or more captions. In most cases, you'll just have a single caption per figure environment, but sometimes you may want to have two figures side-by-side, in which case you'll need two captions within the same figure environment in order to keep the figures together.

To do this, we can use the minipage environment, which was covered in Section 4.7. Recall that the minipage environment creates a horizontal box, which means that two mini-pages can be placed side-by-side on the same line. All you need to do now, is place one image and caption in one minipage, and the other image and caption in the neighbouring mini-page. (Do you remember what effect is obtained by placing a percent symbol at the end of a line?)

[htbp]
\begin{minipage}{0.5\linewidth}

\end{minipage}%
``` ```
\begin{minipage}{0.5\linewidth}

\end{minipage}
A Circle

The above code produces Figures 7.2 and 7.3 on page 254 . Note that each mini-page uses \centering to centre its contents, and the label is also placed in the same mini-page, after the \caption command. If the \(\backslash\) label was not in the same scope as the \caption, the cross-reference would be incorrect.

A common mistake when trying to create side-by-side figures is to do:

[htbp]
\begin{minipage}{0.5\linewidth}

\end{minipage}
``` ```
\begin{minipage}{0.5\linewidth}

\end{minipage}
A Circle

This produces one figure on top of the other, instead of side-by-side. This is because the blank line indicates a paragraph break, so each minipage is in a separate paragraph, so it's not possible for them to be on the same line.

If you want a bit of spacing in your code to make it more readable, use \(\%\) to comment out the paragraph break. For example:
\end\{minipage\}\% }
\%
\begin\{minipage\}\{0.5\linewidth\} }

\subsection*{7.2 Tables}

Tables are produced in much the same way as figures, except that the table environment is used instead.

Figure 7.2 A Circle

Figure 7.3 A Rectangle

A Sample Table[\langleplacement specifiers\rangle]
```Where the optional argument \(\langle\) placement specifiers〉 is as described on page 244. As mentioned at the start of this chapter, tables typically have the caption at the top of the table [17]. With the KOMA-Script classes, such as scrartcl, scrreprt and scrbook, use the class option captions=tableabove to ensure that the vertical spacing appears correctly between the caption and the table content and put \caption at the start of the table environment. Page breaks are not permitted in the table environment. (The longtable package can be used for that instead. See the longtable documentation for further \section*{7 Floats} details.) \section*{Example:} In the preamble:```
\documentclass[captions=tableabove]{scrbook}
Later in the document:
``
〒 Input
\begin{table}[htbp]| Item | Cost |
| :--- | ---: |
| Video | 8.99 |
| CD | 9.99 |
| DVD | 15.00 |

This produces Table 7.1.

Table 7.1 A Sample Table
\begin{tabular}{lr} 
Item & Cost \\
Video & 8.99 \\
CD & 9.99 \\
DVD & 15.00
\end{tabular}

Again, the \centering declaration is used to centre the tabular environment. As with figures, you can create a list of tables using the command

\listoftables

This creates a file with the extension .lot (see Section 2.4). As with the table of contents and list of figures, you will need to ETEX your document twice to get the list of tables up-to-date, unless you're using latexmk (as described in Section 5.5) in which case it will be done automatically.

\section*{Exercise 17 (Creating Tables)}

If you did Exercise 7, you should have a tabular environment in your document. Try turning this into a table, and add Table 7.1. You could also try adding a list of tables. As before, you can download or view the solution.

\subsection*{7.2.1 Side-by-Side Tables}

You can create side-by-side tables using an analogous method to the side-by-side figures approach described above.

\section*{Example:}

This example is similar to the one in Section 7.1.1. Again, take care to ensure that there is no paragraph break between the two minipage environments.
\begin{table}
\begin{minipage}{0.5\linewidth}
\caption{Prices for 2011}
\label{tab:prices2011}
\centering
\begin{tabular}{lr}
Item & Price (£)\\
Widgets & 10.99\\
Whatsits & 5.99
\end{tabular}

\end{minipage}%
%
\begin{minipage}{0.5\linewidth}

| Item | Price (£) |
| :--- | ---: |
| Widgets | 11.99 |
| Whatsits | 6.99 |

\end{minipage}%
\end{table}

This produces Tables 7.2 and 7.3.

Table 7.2 Prices for 2011
\begin{tabular}{lr} 
Item & Price (£) \\
Widgets & 10.99 \\
Whatsits & 5.99
\end{tabular}

Table 7.3 Prices for 2012
\begin{tabular}{lr} 
Item & Price (£) \\
Widgets & 11.99 \\
Whatsits & 6.99
\end{tabular}

\section*{7 Floats}

\subsection*{7.3 Sideways Floats}

The rotating package provides the sidewaysfigure environment:
\(\backslash\) begin\{sidewaysfigure\}
and the sidewaystable environment:
\begin\{sidewaystable\} }
which are like figure and table, respectively, but rotate the entire float (including caption) sideways. This sideways float is always placed on a page of its own.

If you have used the twoside class option (or you are using a class like scrbook, which defaults to that option) then the sideways floats will be rotated clockwise or anti-clockwise, depending on whether they fall on an even (verso) or odd (recto) numbered page. (Requires a second \(\mathrm{ET}_{\mathrm{E}} \mathrm{X}\) run to get it correct.)

\section*{Example:}

$$
\begin{sidewaysfigure}
\centering
\includegraphics[width=0.75\textheight]{shapes}
\caption{A Sideways Figure}
\label{fig:sideways}
\end{sidewaysfigure}
$$

The above code produces Figure 7.4.

\subsection*{7.4 Sub-Floats}

Some floats have sub-floats within them. For example, a figure may contain several sub-figures, each of which requires a caption. The simplest way to do this is to use the subcaption package that provides the subfigure and subtable environments:
\(\backslash\) begin\{subfigure \(\}[\langle\) pos \(\rangle]\{\langle\) width \(\rangle\}\)
\begin\{subtable\}[〈pos } \rangle ] \{ \langle \text { width } \rangle \}

\section*{7 Floats}

\section*{7 Floats}

Within these environments, you can use \caption to create a sub-caption. (In addition to the main \caption for the containing figure or table environment.)

\section*{Note:}

The subcaption package requires the caption package, but doesn't automatically load it, so you'll need to load both:
\usepackage\{caption, subcaption\}

\section*{Example:}

This is very similar to the side-by-side figures example from Section 7.1.1.

[htbp]
\begin{subfigure}[b]{0.5\linewidth}

\end{subfigure}%
%
\begin{subfigure}[b]{0.5\linewidth}

``` ```
\end{subfigure}%
Rectangle

This produces Figure 7.5. Elsewhere in the document, the figure and its components can be referenced:

Figure~ $\backslash$ refffig:shapes2\} shows some shapes.
Figure~ $\backslash r e f\{f i g: r e c t a n g l e\} ~ s h o w s ~ a ~ r e c t a n g l e ~ a n d ~$ Figure~ $\backslash$ ref\{fig:circle\} shows a circle.
which produces the following text:

Figure 7.5 shows some shapes. Figure 7.5 a shows a rectangle and Figure 7.5b shows a circle.

You can also reference just the sub-float using

 7 Floats

\subref\{〈label $\rangle\}$
which is analogous to \ref, but only displays the sub-float number without the number associated with its containing float.

 Example:

Figure~\ref{fig:shapes2} shows: (\subref{fig:rectangle}) a
rectangle and (\subref{fig:circle}) a circle.

produces
Figure 7.5 shows: (a) a rectangle and (b) a circle.

 Note:

The subfigure labels ( $a, b$, etc) should typically be in italic [17]. This can be achieved with the caption package using:
\DeclareCaptionLabelFormat $\{\langle$ format-name $\rangle\}\{\langle$ code $\rangle\}$
where $\langle$ format-name $\rangle$ is the name for this new format and $\langle$ code $\rangle$ is the code used to format the label where \#2 gets replaced by the reference number.

 7 Floats

Figure 7.5 Two Shapes

 7 Floats

Once you have defined a new format, you can then use

\captionsetup[\langletype\rangle]{\langleoptions\rangle}

to switch to that new format. For subfloats, $\langle$ type $\rangle$ needs to be set to sub. The second argument $\langle$ options $\rangle$ is a $\langle k e y\rangle=\langle$ value $\rangle$ comma-separated list. The key that sets the format is labelformat. (For further details about both $\backslash$ DeclareCaptionLabelFormat and \captionsetup, see the caption package documentation.)

For example, to create a format called em-noparens that displays the number in an emphasized font without parentheses:
\DeclareCaptionLabelFormat \{em-noparens\}\{\emph\{\#2\}\}
Now switch to that new format:
\captionsetup[sub] \{labelformat=em-noparens\}
Note that this only changes the caption label format. It doesn't affect the font used by \ref or \subref. For $\backslash r e f$, you can use the fncylab package, which provides the command:
$\backslash$ labelformat $\{\langle c t r\rangle\}\{\langle$ defn $\rangle\}$

 7 Floats

Within $\langle\operatorname{defn}\rangle$, use \#1 to represent the subfigure value and use \thefigure for the encapsulating figure number. For example:
\labelformat\{subfigure\}\{\thefigure $\backslash$ emph \{\#1\}\}
Input
Now
\ref\{fig:circle\}
will produce
7.5a

Output
Unfortunately, this doesn't work for \subref. Instead you will have to do, for example, the following in the text:
\emph\{\subref\{fig:circle\}\}
If you want to add parentheses, the above can be modified to:

\DeclareCaptionLabelFormat{em-parens}{(\emph{#2})}
\captionsetup[sub]{labelformat=em-parens}
\labelformat{subfigure}{\thefigure(\emph{#1})}

For \subref, you will have to do, for example, the following in the text:

7 Floats
(\emph\{\subref\{fig:circle\}\})

 Exercise 18 (Creating Sub-Figures)

Download the image files rectangle.pdf and circle.pdf from http:// www.dickimaw-books.com/latex/novices/html/exercises/ (or create your own images) and add Figure 7.5 to your document. You can download or view the solution.

 8. Defining Commands

It's possible to define your own commands or redefine existing ones. Be very careful about redefining existing commands; don't redefine a command simply because you want to use the name, only redefine it if you are making a modification. For example, if you want to change the format of the current date, you would redefine \today, but if you want to define a command to display a specific date, you should define a new command with a different name.

There are several reasons why you might want to define a new command:

1 Reduce typing:
Suppose you have a series of commands or text that you find yourself frequently using, then you could define a command to do all these other commands for you.

 Example:

Suppose you want a lot of large bold slanted sans-serif portions of text within your document. Every time you type those portions of text, you will have to do something like:
\textsf\{\large\bfseries\slshape Some text\}
It would be much easier if you could use just one command to do all that, called, say, \largeboldsfsl:
\largeboldsfsl\{Some text\}
or you could call it, say, \lbsfsl which is shorter, but slightly less memorable:
\lbsfsl\{Some text\}
2. Ensure consistency:

You may find that you want to format an object a certain way.

 Example:

Recall near the end of Section 7.4, I suggested the following to reference a subfigure (when using \subref instead of $\backslash r e f$ ):
(\emph\{\subref\{fig:circle\}\})
For consistency, you might want to define a command, say,
$\backslash$ formattedsubref\{〈label $\rangle\}$
that was the same as $(\backslash \operatorname{emph}\{\backslash$ subref $\{\langle$ label $l\rangle\}\}$ ).

 Another Example

Suppose your document has a lot of keywords in it, and you want to format these keywords in a different font, say sans-serif, so that they stand out. You could just do:

A \textsf\{command\} usually begins with a backslash.
however, it is better to define a new command called, say, \keyword that will typeset its argument in a sans-serif font. That way it becomes a lot easier to change the format at some later date. For
example, you may decide to splash out and have your keywords typed in a particular colour. In which case, all you need to do is simply change the definition of the command $\backslash$ keyword, otherwise you'll have to go through your entire document looking for keywords and changing each one which could be very time consuming if you have a large document. You might also decide at some later date to make an index for your document. Indexing all the keywords then becomes much simpler, as again all you'll need to do is modify the $\backslash$ keyword command.

New commands are defined using the command:
$\backslash$ newcommand $\{\langle$ cmd $\rangle\}[\langle$ n-args $\rangle][\langle$ default $\rangle]\{\langle$ text $t\rangle\}$
The first mandatory argument $\langle c m d\rangle$ is the name of your new command, which must start with a backslash. The optional argument $\langle n$-args $\rangle$ specifies how many arguments your new command must take. The next optional argument $\langle$ default $\rangle$ will be discussed later. The final mandatory argument $\langle$ text $\rangle$ specifies what $\mathrm{ET}_{\mathrm{EX}}$ should do every time it encounters this command.

 8 Defining Commands

 Example (No Parameters):

Let's begin with a trivial example. Suppose I wanted to write a document about a particular course, say "Programming - Languages and Software Construction", and I had to keep writing the course title, then I might decide to define a command that prints the course title rather than having to laboriously type it out every time. Let's call our new command \coursetitle. We want the following code:

The course $\backslash e m p h\{\backslash$ coursetitle\} is an undergraduate course.
to produce the following output:

The course Programming - Languages and Software Construction is an undergraduate course.

Clearly this command doesn't need any arguments, so we don't need to worry about the optional argument $\langle n$-args $\rangle$ to \newcommand, and the only thing our new command needs to do is print:

Programming --- Languages and Software Construction
so we would define our new command as follows:

8 Defining Commands

\newcommand{\coursetitle}{Programming --- Languages and Software
Construction}

Commands must always be defined before they are used. The best place to define commands is in the preamble:
\documentclass{scrartcl}
\newcommand{\coursetitle}{Programming --- Languages
and Software Construction}
\begin{document}

 \coursetitle

The course \emph{\coursetitle} is an undergraduate course.
\end{document}

 8 Defining Commands

 Example (One Mandatory Argument):

Now let's try defining a command that takes an argument (or parameter). Let's go back to our \keyword example on page 271. This command needs to take one argument that is the keyword. Let's suppose we want keywords to come out in sans-serif, then we could do:
\newcommand\{\keyword\}[1]\{\textsf\{\#1\}\}
In this case we have used the optional argument $\langle n$-args $\rangle$ to \newcommand. We want our command $\backslash$ keyword to have one argument, so we have [1]. In \textsf\{\#1\} the \#1 represents the first argument. (If we had more than one argument, \#2 would represent the second argument, \#3 would represent the third argument etc. up to a maximum of 9.) So
\keyword\{commands\}
[FAQ: How to break the
9 -argument limit]
will be equivalent to
\textsf\{commands\}
and
\keyword\{environment\}
will be equivalent to

 8 Defining Commands

\textsf\{environment\}
and so on. Again, it's best to put the command definition in the preamble to ensure the command won't be used before it's defined.
\documentclass{scrartcl}
\newcommand{\keyword}[1]{\textsf{\#1}}
$$
\begin{document}
A \keyword{command} usually begins with a backslash.
\end{document}
$$

Now if we want to change the way the keywords are formatted, we can simply change the definition of \(\backslash\) keyword. Let's modify our code so that the keyword is now in a slanted sans-serif font:

8 Defining Commands

\documentclass{scrartcl}
\newcommand{\keyword}[1]{\textsf{<br>slshape \#1}}
$$
\begin{document}
A \keyword{command} usually begins with a backslash.
\end{document}
$$

Let's go one stage further. The color package provides the declaration:
\color \(\{\langle\) col-name \(\rangle\}\)
which switches the foreground colour to \(\langle\) col-name〉. It also provides the text-block command:
\(\backslash\) textcolor \(\{\langle\) col-name \(\rangle\}\{\langle\) text \(\rangle\rangle\}\)
which sets \(\langle\) text \(\rangle\) in the colour given by \(\langle\) col-name \(\rangle\).
So let's use the color package to make our keywords blue:

8 Defining Commands
\documentclass{scrartcl}
\usepackage{color}
\newcommand{\keyword}[1]{\textsf{\slshape\color{blue}#1}}
\begin{document}
A \keyword{command} usually begins with a backslash.
\end{document}

$\qquad$

Or we could index the keywords. To do this we need the makeidx package and the commands eindex,$\backslashindex\{\langle$text$\rangle\}$and$\backslash$printindex:\documentclass\{scrartcl\}\usepackage\{makeidx\}undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

 8 Defining Commands

\makeindex
\newcommand{\keyword}[1]{\textsf{\slshape #1}\index{#1}}
\begin{document}
A \keyword{command} usually begins with a backslash.
\printindex
\end{document}

For further information about how to create an index, see $A$ Guide to ${ }^{E} T_{E} X$ [7] or The $E T_{E} X$ Companion [3]. Alternatively, if you want a brief overview, try Using ${ }^{A} T_{E} X$ to Write a PhD Thesis [13].

Since it is unlikely that the keyword will contain a paragraph break, we should indicate that this is a short command using the starred form:
\newcommand*\{\keyword\}[1]\{\textsf\{\slshape \#1\}\index\{\#1\}\}
Now if you forget to add the closing brace, for example, $\backslash$ keyword\{command, then $\mathrm{T}_{E} \mathrm{X}$ 's error checking mechanism will pick up the error sooner. This

 8 Defining Commands

will give an error message that looks like:
! Paragraph ended before \keyword was complete.
<to be read again>

\par

1.604

This at least gives you the line number (604 in this example) of the end of the paragraph where the error has occurred.

If you don't used the starred form of $\backslash$ newcommand, then you will get the somewhat less than helpful error:
! File ended while scanning use of $\backslash$ keyword.
If you have a very large document, it may take a while to track down where exactly you have missed a brace.

 Exercise 19 (Defining a New Command)

Try typing up the following code:

8 Defining Commands

\uparrow Code
\documentclass{scrartcl}
\newcommand*{\keyword}[1]{\textsf{#1}}
\begin{document}
A \keyword{command} usually begins with a backslash.
Segments of code may be \keyword{grouped}.
Some \keyword{commands} take one or more \keyword{arguments}.
\end{document}

$\qquad$

Then modify your code so that the keywords are in a slanted sans-serif font or modify your code so that the keywords come out in blue (using the color package as in the example earlier). Again you can download or view the result.

 8 Defining Commands

 For the more adventurous:

If you want to create an index as in the previous example, you will need to use the application makeindex. If you used latexmk back in Section 5.5, you can just carry on using that as before. If not you need to do the following in TeXworks:

1 Create the PDF as described in Section 3.1.
2 Select Makelndex from the drop-down list next to the build (typeset) button (see Figure 8.1).
3 Click on the build button. If all goes well, you won't see anything different. If you see something like the following:
Couldn't find input index file exercise19 nor exercise19.idx.
then you probably forgot to add the command $\backslash$ makeindex to the preamble. Add it in and go back to Step 1.
4. Select pdfLaTeX from the drop-down list and build the PDF file again. Move to the last page of the PDF, and you should see the index.

 8 Defining Commands

Figure 8.1 Selecting MakeIndex in TeXWorks

 8 Defining Commands

 8.1 Defining Commands with an Optional Argument

As mentioned earlier, the \newcommand command has a second optional argument $\langle$ default $\rangle$. This allows you to define a command with an optional
argument. For example, suppose we want a command called, say, \price. Suppose we want the following code:
$\backslash$ price $\{100\}$
to produce the following output:
£100 excl VAT @ 17.5\%
[FAQ: More than
one optional
argument]
Input

Output
and let's suppose we want an optional argument so that we can change the VAT. That is, we would want the following code:
$\backslash$ price[20] \{30\}
to produce the following output:
£30 excl VAT @ 20\%
Therefore we want to define a command such that if the optional argument is absent we will have 17.5, and if it is present the optional argument will be substituted instead. This command can be defined as follows:
\newcommand\{\price\}[2][17.5]\{£ \#2 excl VAT @ \#1<br>%\}

 8 Defining Commands

Here, \#1 represents the optional argument (by default 17.5) and \#2 represents the mandatory argument (the second argument if the optional argument is present, or the only argument if the optional argument is absent.)

As before, since the argument is unlikely to contain a paragraph break, we should indicate that it is a short command using the starred form:

\newcommand*{\price}[2][17.5]{\pounds #2 excl VAT @ #1\%}

 Exercise 20 (Defining Commands with an Optional Argument)

In this exercise, you will need to define a slightly modified version of the above example. Try defining a command called, say, \cost. It should take one optional argument and one mandatory argument. Without the optional argument, it behaves in the same way as the \price example above, so that, say,
\cost\{50\}
will produce
£50 excl VAT @ 17.5\%
but with the optional argument, you can change the excl VAT @ $17.5 \backslash \%$ bit. So that, say,

 8 Defining Commands

$\backslash \operatorname{cost}[$ inc VAT] $\{50\} \quad$ Input
will produce
$£ 50$ inc VAT
You can download or view the solution.

 FOR THE MORE ADVENTUROUS:

If you did Exercise 19 and you modified $\backslash$ keyword so that it indexed the keyword, you may have noticed that
$\backslash$ keyword\{command\}
and
\keyword\{commands\}
produced separate entries in the index. It would be better to have an optional argument to override the indexing mechanism. For example,
\keyword\{command\}
should print and index the word "command", whereas
\keyword[command] \{commands\}

 8 Defining Commands

should print "commands" and index "command". In other words, we need an optional argument that defaults to the mandatory argument if it is not present. This is how to achieve that type of effect: ${ }^{8.1}$

\newcommand*{\keyword}[2][\keywordentry]{%
\def\keywordentry{#2}%
\textsf{#2}%
\index{#1}%
}

In this example, the default value for the optional argument is set to the command \(\backslash\) keywordentry. At the start of \(\backslash\) keyword this is defined to be the mandatory argument (as specified by \#2) using TEX's \(\backslash \operatorname{def}\) command: \({ }^{8.2}\)
\(\backslash\) def \(\backslash\) keywordentry\{\#2\}
Then typeset the keyword (given in the mandatory argument \#2) in a sansserif font:

\footnotetext{
\({ }^{8.1}\) Recall from Chapter 2 (Some Definitions) the percent symbol discards the space resulting from the end of line character.
\({ }^{8.2} \backslash\) def is too complicated for an introductory LATEX guide but, if you're interested, read The \(T_{E}\) Xbook [6].
}

\section*{8 Defining Commands}
\textsf\{\#2\}
Now index the term using the optional argument (\#1):
\index\{\#1\}
If an optional argument is specified, \#1 will be the given argument, but if the optional argument is missing, \#1 will be \(\backslash\) keywordentry, which has earlier been set to the mandatory argument \#2.

\subsection*{8.2 Redefining Commands}

Commands can be redefined using the command:
\(\backslash\) renewcommand \(\{\langle\mathrm{cmd}\rangle\}[\langle\) n-args \(\rangle][\langle\) default \(\rangle]\{\langle\) text \(\rangle\}\)
This has exactly the same format as \(\backslash\) newcommand but is used for redefining existing commands. Again there is a starred version to indicate that the command is a short command.

\section*{8 Defining Commands}

\section*{Caveat:}

Never redefine a command whose existing function is unknown to you or just because you want to use a particular command name, regardless of its previous function. By way of illustration: as a production editor, I have to combine articles by different authors into a single book. Each author supplies the ETEX code for their own article. Every so often, I get code that redefines a command for the convenience of the author. Later on another author tries to use the same command, on the assumption that the command behaves according to its original definition. This tends to involve the accent commands as they are short and that saves the author typing. It usually goes along these lines: author A redefines \c (the cedilla accent command) to display a maths bold " \(c\) " to indicate a vector. Later, author B, uses the cedilla accent, say, in the name François:

\section*{Fran\c\{c\}ois}

Author A's hack turns this into Franccois.

\section*{Example (Redefining List Labels):}

Recall the itemize environment discussed in Section 4.4.1. You may have up to four nested itemize environments, the labels for the outer environment are specified by the command \labelitemi, the labels for the second level are specified by \labelitemii, the third by \labelitemiii and the fourth by \labelitemiv. By default, \labelitemi is a bullet point

\section*{8 Defining Commands}
\((\bullet)\), \labelitemii is an en dash (-), \labelitemiii is an asterisk (*) and \(\backslash\) labelitemiv is a centred dot (•). These can be changed by redefining \(\backslash\) labelitemi etc.

Recall from Table 4.2 that the command \dag produces a dagger symbol, we can use this symbol instead of a bullet point:

                                - Animal
                                - Mineral
                                - Vegetable
Output:

8 Defining Commands

8 Defining Commands

Output:

\ \utput
Animal
Mineral
Vegetable

$\llcorner$

In the above example, it would actually be easier to use the dinglist environment defined in the pifont package:

\begin\{dinglist\}\{43\} }

- Animal

- Mineral

- Vegetable
\end\{dinglist\} }

Example (Redefining the Default Font):
Recall from Section 4.5 .3 that the default font family is usually the serif (Roman) family. So what happens if you need to write your entire document in, say, Helvetica? The default font family name is stored in:
$\backslash$ familydefault
This command is usually defined to be just $\backslash$ rmdefault, which in turn stores the name of the default serif font (initially cmr, Computer Modern Roman). If you want the default font to be sans-serif, all you need do is add the following line to the preamble:
\{\sfdefault\}
\sfdefault stores the name of the default sans-serif font (initially cmss, Computer Modern Sans-Serif) and the helvet package redefines $\backslash s f d e f a u l t$ to phv, which is the identifier for the Helvetica font. So the following document will be in Helvetica:

 8 Defining Commands

\documentclass\{scrartcl\}\usepackage\{helvet\}\{\sfdefault\}\begin\{document\}}Thisisasampledocument.\end\{document\}}Similarly,ifyouwantthedefaultfonttobemonospaced(typewriter)thenyou'dneedtodo:undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

\renewcommand{\familydefault}{\ttdefault}

Incidentally, you may have noticed in Section 4.5.3 that although I said I'd used the anttor and libris packages to set the serif and sans-serif families for this book, I didn't mention anything about the typewriter (monospaced) font. I used the TXTT font, but that doesn't have a corresponding package. You just redefine \ttdefault to txtt:
\{txtt\}

 8 Defining Commands

 Example（Redefining Fixed Names）：

You may have noticed that $\mathrm{ET}_{\mathrm{EX}}$ automatically generates pieces of text such as＂Chapter＂，＂Figure＂，＂Bibliography＂．These are generated by the commands shown in Table 8．1．

You can change the defaults using  \{Table of Contents\}
In fact，the babel package（see Section 5．8）uses this method to redefine the commands in Table 8.1 whenever you switch language using $\backslash$ selectlanguage or within the contents of the otherlanguage environment． This unfortunately has the side－effect that means if you try to redefine these commands，babel will automatically overwrite your definition when－ ever there＇s a language change，which includes at the beginning of the document environment．Instead you need to use babel＇s \addto mechanism．
\addto $\{\langle$ command $\rangle\}\{\langle$ code $\rangle\}$
This patches the definition of a command（specified in the first argument） adding 〈code〉 to the end of the command definition．Whenever babel switches the current language，it uses the command \captions〈language〉，
［FAQ：Changing the words babel uses］

Table 8.1 Predefined Names ( ${ }^{\dagger}$ Book and report style classes (such as scrreprt and scrbook), $\ddagger$ article-style classes (such as scrartcl), remainder book, report and article-style classes)

| Command | Default Text |
| :---: | :---: |
| \contentsname | Contents |
| $\backslash$ listfigurename | List of Figures |
| $\backslash$ listtablename | List of Tables |
| $\backslash$ bibname $^{\dagger}$ | Bibliography |
| $\backslash$ refname ${ }^{\ddagger}$ | References |
| \indexname | Index |
| $\backslash$ figurename | Figure |
| \tablename | Table |
| $\backslash$ partname | Part |
| $\backslash$ chaptername ${ }^{\dagger}$ | Chapter |
| $\backslash$ \appendixname | Appendix |
| \abstractname | Abstract |

 8 Defining Commands

which performs all the redefinitions of commands like those listed in Table 8.1. For example, if you are using babel with the english option and you want to change \contentsname so that it does "Table of Contents" instead of "Contents", you need to do:

\addto{\captionsenglish}{%
\renewcommand{\contentsname}{Table of Contents}%
}

 Notes:

Take care if you want to patch an existing command. For example, suppose you want to append something to the action of a command. You might be tempted to do
$\backslash$ renewcommand*\{ $\backslash$ foo $\}\{$ foo Something else $\}$
This will cause an infinite loop where $\backslash$ foo recursively calls itself. Instead you should use one of the commands provided by the etoolbox package (such as \appto, which has the same syntax as babel's \addto described above). For further details, read the etoolbox documentation.

8 Defining Commands

 Exercise 21 (Renewing Commands)

If you did Exercises 16 and 17, go back to that document and changed the figures and tables so that they are labelled "Fig" and "Tab" instead of "Figure" and "Table". Hint: you need to redefine $\backslash$ tablename and $\backslash$ figurename.

You can download or view the solution.

 9. Mathematics

As mentioned in the introduction, ETEX is particularly good at typesetting mathematics. In order to use any of the maths commands we need to be in one of the mathematics environments. There are two basic types of mathematics: in-line maths and displayed maths. In-line maths is mathematics that occurs within a line of text, for example:

The variable $x$ is transformed by the function $f(x)$.
Displayed maths is mathematics that occurs on a line of its own. For example:

A polynomial is a function of the form

$$
f(x)=\sum_{i=0}^{n} a_{i} x^{i}
$$

$\qquad$

 9 Mathematics

The maths environments switch to $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ 's "math mode", which uses specialist maths fonts and spacing rather than just using an italic font.

If you want to typeset any mathematics, I strongly advise using the amsmath package:
msmath\}Thispatchessomeexisting${}^{\mathrm{LT}}\mathrm{E}_{\mathrm{E}}\mathrm{X}$commandsandenvironmentsandalsoprovidesmanyusefuladditions.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

This chapter is just an introduction to typesetting mathematics in EATEX. If you want a comprehensive guide, I recommend you read Math Mode by Herbert Voß [20], which can be access via texdoc (see Section 1.1):
texdoc mathmode

 9.1 In-Line Mathematics

In-line mathematics is created using the math environment. (Note U.S. spelling - "math" not "maths").

Example:

 9 Mathematics

 The variable $\backslash$ begin\{math $\}$ x $\backslash$ end\{math $\}$ is transformed by the function $\backslash$ begin\{math $\} f(x) \backslash e n d\{m a t h\}$.

It's somewhat cumbersome having to type \begin\{math\} and \end\{math\} } and it also makes the source code a little difficult to read so there are shorthand notations that can be used instead: $\backslash$ ( is equivalent to \begin } \{math\} and $\backslash$ ) is equivalent to \end\{math\}. So the example above can be } rewritten:
The variable $\backslash(x \backslash)$ is transformed by the function $\backslash(f(x) \backslash)$.
There is an even shorter notation: The special character $\$$ is equivalent to both \begin\{math\} and \end\{math\}: }

The variable $\$ \mathrm{x} \$$ is transformed by the function $\$ \mathrm{f}(\mathrm{x}) \$$.
This is considerably easier to type and to read, but you need to make sure that all your \$ symbols have matching pairs. The above code will look like:

The variable $x$ is transformed by the function $f(x)$.
The other advantage in using $\$$ over $\backslash$ ( and $\backslash$ ) is that $\$$ is a robust command, whereas $\backslash$ ( and $\backslash$ ) are fragile commands and will need to be protected if they occur in a moving argument.

 9 Mathematics

Note: you should always make sure you are in maths mode to typeset any variables (such as $x, y, z$ ), as this will ensure that the correct maths fonts are used, as well as the appropriate spacing. Similarly, don't use \$ as a short cut for an italic font.
Notice the \$difference\$ between \$(x', y', z')\$ and \textit\{(x', $\left.\left.y^{\prime}, z^{\prime}\right)\right\}$.

Notice the difference between ( $x^{\prime}, y^{\prime}, z^{\prime}$ ) and ( $x^{\prime}, y^{\prime}, z^{\prime}$ ).

 9.2 Displayed Mathematics

One-line unnumbered displayed mathematics can be created using:
$\backslash[\langle$ maths $\rangle \backslash]$
where $\langle$ maths $\rangle$ is the mathematics to be displayed.
Example:

9 Mathematics

A linear function is a function of the form
$\backslash[\mathrm{y}=\mathrm{mx}+\mathrm{c} \backslash]$

Output:

A linear function is a function of the form

$$
y=m x+c
$$

Don't use the displaymath environment or $\$ \$ \ldots \$ \$$ [15]. Use $\backslash[$ and $\backslash]$ with the amsmath package.

The equation environment provides something similar to $\backslash[\backslash]$, except that the equation is numbered. Modifying the above example:

9 Mathematics

A linear function is a function of the form $\backslash$ begin\{equation\}
$y=m x+c$
\end\{equation\} }
$\qquad$
results in the following output:

A linear function is a function of the form

$$
\begin{equation*}
y=m x+c \tag{9.1}
\end{equation*}
$$

$\square$
Normal text can be inserted into the equation using
$\backslash \operatorname{text}\{\langle$ text $\rangle\}$
which is provided by the amsmath package.

9 Mathematics

 Example:

$$
\(\mathrm{x}=2\) ไtext \(\{\) and \(\} \mathrm{y}=-1\)
$$

Input
results in the following output:

$$
x=2 \text { and } y=-1
$$

$\qquad$
Recall from Section 5.5 that we can cross-reference most things that LATEX automatically numbers using $\backslash r e f$ and $\backslash$ label. Equations can be cross-referenced in the same way:

Equation~\ref\{eqn:linear\} is a linear function.
\begin\{equation\} }
$\backslash$ label\{eqn:linear\} $f(x)=m x+c$ \end\{equation\} }

9 Mathematics
$\qquad$

Equation 9.2 is a linear function.

$$
\begin{equation*}
f(x)=m x+c \tag{9.2}
\end{equation*}
$$

$\qquad$
Equation numbers are usually given in parentheses, which can be done using:

Equation~(\ref\{eqn:linear\})
The amsmath package provides a convenient short cut:
$\backslash$ eqref $\{\langle$ label $\rangle\}$
So the above can be written as:
Equation~\eqref\{eqn:linear\}
Equation (9.2)

9 Mathematics

 Note:

Both the equation environment and $\backslash[\ldots \backslash]$ are only designed for one line of maths. Therefore you must not have any line breaks or paragraph breaks within them. The following will cause an error:
$\backslash$ begin\{equation\}
$f(x)=m x+c$
\end\{equation\} }
Either remove the blank lines or comment them out:

\begin{equation}
%
f(x) = mx + c
%
\end{equation}

 9.3 Multiple Lines of Displayed Maths

The amsmath package provides the align and align* environments for aligned equations. The starred version doesn't number the equations. These environments provide pairs of left- and right-aligned columns. As with the

 9 Mathematics

tabular environment, use \& to separate columns and <br>
\ to separate rows. Unlike the tabular environment, there is no argument as the column specifiers are predefined. Another difference is that no page breaks can occur in the tabular environment, but it's possible to allow a page break in align or align* using
\displaybreak[ $\langle n\rangle]$
immediately before the $\backslash \backslash$ where it is to take effect. The optional argument is a number from 0 to 4 indicating the desirability to break the page (from 0 the least to 4 the most).

If you want to mix numbered and unnumbered rows, you can use

\notag

to suppress the numbering for a particular row in the align environment. This command must go before $\backslash \backslash$ at the end of the row. The default equation numbering can be overridden for a particular row using:
$\backslash \operatorname{tag}\{\langle\operatorname{tag}\rangle\}$
where $\langle\operatorname{tag}\rangle$ is the replacement for the equation number.

9 Mathematics

Don't use the eqnarray or eqnarray ${ }^{*}$ environments. They're obsolete [15].
Example (UnNumbered):

\begin\{align*\} }
\(y \&=2 x+2 \backslash \backslash\)
\(\&=2(x+1)\)
\end\{align*\} }

\[
\begin{aligned}
y & =2 x+2 \\
& =2(x+1)
\end{aligned}
\]

Note that the equals sign is placed at the start of the second column, after the ampersand \& This ensures the correct amount of spacing on either side. If the first line of the above equation was changed to:

9 Mathematics
\(y=\& 2 x+2 \backslash \backslash\)
there wouldn＇t be enough space on the right of the equal sign：
\[
y=2 x+2
\]

\section*{Example（One Row Numbered）：}

$$
\begin{align} 左涪ut
y &= 2x + 2\notag\\
&=2(x+1)
\end{align}
$$ \& \& Input

\(\square\) 〒 Output
\[
\begin{align*}
y & =2 x+2 \\
& =2(x+1) \tag{9.3}
\end{align*}
\]

9 Mathematics

\section*{Example (Four Columns):}

y \&= 2x + 2 \& z \&= 6x + 3<br>
\&=2(x+1) \& \&= 3(2x+1)
\end{align*}

$$
\begin{array}{rlrl}
y & =2 x+2 & z & =6 x+3 \\
& =2(x+1) & & =3(2 x+1)
\end{array}
$$

As with equation, you can cross-reference individual rows of an align environment, but you must remember to put \label before the end of row $\backslash \backslash$ separator. You can reference a row in the align* environment if you have assigned it a tag with \tag, but don't try labelling a row in the align environment where the numbering has been suppressed with \notag.

 9 Mathematics

 Example (Cross-Referenced):

This example has two numbered equations in an align environment, both of which are labelled and referenced:

The function $\$ f(x) \$$ is given in Equation~ $\backslash$ eqref $\{e q: f x\}$, and its derivative $\$ f^{\prime}(x) \$$ is given in Equation~\eqref\{eq:dfx\}.
$\backslash$ begin\{align\}
$f(x) \&=2 x+1$ label\{eq:fx\}<br>
$f^{\prime}(x) \&=2 \backslash l a b e l\{e q: d f x\}$
\end\{align\} }

The function $f(x)$ is given in Equation (9.4), and its derivative $f^{\prime}(x)$ is given in Equation (9.5).

$$
\begin{align*}
f(x) & =2 x+1  \tag{9.4}\\
f^{\prime}(x) & =2 \tag{9.5}
\end{align*}
$$

 9 Mathematics

Recall the command $\backslash$ text $\{\langle$ text $\rangle\}$ from the previous section. This can be used within cells of the align and align ${ }^{*}$ environments, but the amsmath package also provides

\intertext{\langletext\rangle}

which can be used for a line of interjection between the rows. This command may only go right after $\backslash \backslash$.

 Example

\begin{align*}
y &= 2x + 2\\
\intertext{Using the distributive law:}
&= 2(x+1)
\end{align*}

9 Mathematics
Using the distributive law:
\[
=2(x+1)
\]

There are other environments for multiple-line displayed maths, but they are beyond the scope of this book. See the amsmath documentation for further details.

\subsection*{9.4 Mathematical Commands}

Most of the commands described in this section may only be used in one of the mathematics environments. If you try to use a mathematics command outside a maths environment you will get a "Missing \$ inserted" error message.

\subsection*{9.4.1 Maths Fonts}

Just as we are able to change text fonts using the commands \textrm, \textbf etc, we can also use commands to change the maths font. Basic maths font changing commands are shown in Table 9.1.

\section*{Table 9.1 Maths Font Changing Commands}
\begin{tabular}{|c|c|c|}
\hline Command & Example Input & Corresponding Output (Computer Modern) \\
\hline \(\backslash\) mathrm\{ \({ }^{\text {a maths }\rangle \text { \} }}\) & \$ \(\backslash\) mathrm\{xyz\} \$ & xyz \\
\hline \(\backslash m a t h s f\{\langle\) maths \(\rangle\) \} & \$ \(\backslash\) maths \(f\{x y z\}\) \$ & \(x y z\) \\
\hline \(\backslash\) mathtt \(\{\langle\) maths \(\rangle\) \} & \$ \(\backslash\) mathtt \(\{\mathrm{xyz}\) \} \$ & xyz \\
\hline \(\backslash\) mathit \{ \(\langle\) maths \(\rangle\) \} & \$ \(\backslash\) mathit \(\{\mathrm{xyz}\) \} \$ & \(x y z\) \\
\hline \(\backslash\) mathbf \(\{\langle\) maths \(\rangle\}\) & \$ \(\backslash\) mathbf \(\{\mathrm{xyz}\}\) \$ & xyz \\
\hline \(\backslash\) mathcal \(\{\langle\) maths \(\rangle\) \} & \$ \(\backslash\) mathcal \(\{\mathrm{XYZ}\) \} \$ & 9xyz \\
\hline
\end{tabular}

The calligraphic fonts via \mathcal are only available for upper-case characters. Table 9.2 lists additional font commands supplied with the amsmath and amsfonts packages.
[FAQ: Better script fonts for maths]

\subsection*{9.4.2 Greek Letters}

Greek letters that differ from the corresponding Roman letters are obtained by placing a backslash in front of the name. \({ }^{9.1}\) Lower case and

\footnotetext{
\({ }^{9.1}\) So, for example, there is no omicron since it looks the same as a Roman o.
}

9 Mathematics
Table 9.2 The amsfonts \({ }^{\ddagger}\) and amsmath \({ }^{\dagger}\) Font Commands
\begin{tabular}{lll}
\hline Command & Example Input & Example Output \\
\hline\(\ddagger \backslash\) mathbb \(\{\langle\) maths \(\rangle\}\) & \(\$ \backslash\) mathbb \(\{\mathrm{A}+\mathrm{B}=\mathrm{C}\} \$\) & \(\mathbb{A}+\mathbb{B}=\mathbb{C}\) \\
\(\ddagger \backslash\) mathfrak \(\{\langle\) maths \(\rangle\}\) & \(\$ \backslash\) mathfrak \(\{\mathrm{A}+\mathrm{B}=\mathrm{C}\} \$\) & \(\mathfrak{A}+\mathfrak{B}=\mathfrak{C}\) \\
\(\dagger \backslash\) boldsymbol \(\{\langle\) maths \(\rangle\}\) & \(\$ \backslash\) boldsymbol \(\{\) A \(+\mathrm{B}=\mathrm{C}\} \$\) & \(\boldsymbol{A}+\boldsymbol{B}=\boldsymbol{C}\) \\
\(\dagger \backslash \operatorname{pmb}\{\langle\) symbol \(\rangle\}\) & \(\$ \backslash \operatorname{pmb}\{+-=\} \$\) & \(+-=\) \\
\hline
\end{tabular}
upper case Greek letters are shown in Table 9.3 and Table 9.4, respectively. There are also some variants of certain symbols, such as \vartheta as opposed to \theta.

\section*{Example:}

The following code
\[ x ' = \(\mathrm{x}+\backslash\) Delta \(\mathrm{x} \backslash]\)
produces:
\[
x^{\prime}=x+\Delta x
\]

Input

Output

9 Mathematics

Table 9.3 Lower Case Greek Letters

\(\backslash\) Sigma & \(\Sigma\) & \(\backslash\) Upsilon & \(\Upsilon\) & \(\backslash\) Phi & \(\Phi\) \\
\(\backslash\) Psi & \(\Psi\) & \(\backslash\) Omega & \(\Omega\) & &
\end{tabular}

9 Mathematics

\subsection*{9.4.3 Subscripts and Superscripts}

Subscripts are obtained either by the command
\(\backslash\) sb \(\{\langle\) maths \(\rangle\}\)
or by the special character:
_\{〈maths \(\rangle\}\)
Superscripts are obtained either by the command
\(\backslash \mathrm{sp}\{\langle\) maths \(\rangle\}\)
or by the special character:
\({ }^{\wedge}\{\langle\) maths \(\rangle\}\)

\section*{Examples:}
1. This example uses \(\backslash \mathrm{sb}\) and \(\backslash \mathrm{sp}\) :
\[
\backslash[y=x \backslash \operatorname{sb}\{1\} \backslash \operatorname{sp}\{2\}+x \backslash \operatorname{sb}\{2\} \backslash \operatorname{sp}\{2\} \backslash]
\]

9 Mathematics
2. This example uses _ and ^
\[
\backslash\left[y=x_{-}\{1\}^{\wedge}\{2\}+x_{-}\{2\}^{\wedge}\{2\} \backslash\right]
\]
3. Recall from page 33 that mandatory arguments only consisting of one character don't need to be grouped, so the above code can also be written as:
\[
\backslash\left[y=x \_1^{\wedge} 2+x \_2^{\wedge} 2 \backslash\right]
\]

This is simpler than the first two examples. However it's a good idea to be in the habit of always using braces in case you forgot them when they're needed.

All three of the above examples produce the same output:
\[
y=x_{1}^{2}+x_{2}^{2}
\]

Notice how the subscript gets tucked under the slope of the \(Y\) in:
\(\backslash\left[Y_{-}\{1\}^{\wedge}\{2\} \backslash\right]\)

Input

Output

9 Mathematics

Compare with
\(\backslash\left[\mathrm{Y}\left\}_{-}\{1\} \wedge\{2\} \backslash\right]\right.\)
Input
\(Y_{1}^{2}\)
Output

\section*{Example (Nested)}

Subscripts and superscripts can also be nested (note that it is now necessary to group the argument to the superscript command):
\(\backslash\left[f(x)=e^{\wedge}\left\{x \_1\right\} \backslash\right]\)
which produces
\[
f(x)=\mathrm{e}^{x_{1}}
\]

This example isn't quite right as e isn't actually a variable and shouldn't be typeset in italic. The correct way to do this is:
\(\backslash[\mathrm{f}(\mathrm{x})=\) \mathrm\{e\}^\{x_1\} \]
which results in:
\[
f(x)=\mathrm{e}^{x_{1}}
\]

If you are going to use e a lot, it will be simpler to define a new command to do this. The definition should go in the preamble:

\section*{9 Mathematics}
\(\backslash\) newcommand \(\{\backslash e\}\{\backslash\) mathrm \(\{e\}\}\)
Input
Then in the document:
\(\backslash\left[f\left(x \_1, x \_2\right)=\backslash e^{\wedge}\left\{x \_1^{\wedge} 2\right\}+\backslash e^{\wedge}\left\{x \_2^{\wedge} 2\right\} \backslash\right]\) Input
\[
f\left(x_{1}, x_{2}\right)=\mathrm{e}^{x_{1}^{2}}+\mathrm{e}^{x_{2}^{2}}
\]

Take care when nesting subscripts or superscripts. The following
x_1_2
will give a ! Double subscript error.

\subsection*{9.4.4 Functional Names}

Functions such as log and tan can't simply be typed in as log or tan otherwise they will come out looking like the variables \(l\) times o times \(g\) (log) or \(t\) times \(a\) times \(n\) (tan). Instead you should use one of the commands listed in Table 9.5. The functions denoted with \({ }^{\dagger}\) can have limits by using the subscript command _ or the superscript command \(\wedge\). In addition, the modulo commands listed in Table 9.6 are also available.
[FAQ: Sub- and superscript positioning for operators]

9 Mathematics

Table 9.5 Function Names ( \({ }^{\dagger}\) indicates command may have limits, \({ }^{\ddagger}\) defined by amsmath).
\begin{tabular}{|c|c|c|c|c|c|}
\hline \(\backslash \mathrm{arccos}\) & arccos & \(\backslash\) arcsin & arcsin & \arctan & arctan \\
\hline \(\backslash \mathrm{arg}\) & arg & \(\backslash \mathrm{cos}\) & cos & \(\backslash\) cosh & cosh \\
\hline \cot & cot & \(\backslash\) coth & coth & \csc & csc \\
\hline \(\backslash\) deg & deg & \(\backslash \mathrm{det}^{\dagger}\) & det & \(\backslash \mathrm{dim}\) & dim \\
\hline \(\backslash \mathrm{exp}\) & exp & \(\backslash \mathrm{gcd}^{\dagger}\) & gcd & \(\backslash \mathrm{hom}\) & hom \\
\hline \(\backslash i n f{ }^{\dagger}\) & inf & \(\backslash i n j 1 i m{ }^{\dagger}{ }^{\text {¢ }}\) & inj lim & \(\backslash\) ker & ker \\
\hline \(\backslash \mathrm{lg}\) & 1 g & \(\backslash \mathrm{lim}^{\dagger}\) & lim & \(\backslash \mathrm{liminf}{ }^{\dagger}\) & lim inf \\
\hline \(\backslash\) limsup \(^{\dagger}\) & limsup & \(\backslash \mathrm{ln}\) & ln & \(\backslash \log\) & \(\log\) \\
\hline \(\backslash\) max \(^{\dagger}\) & max & \(\backslash\) min \(^{\dagger}\) & min & \(\backslash \mathrm{Pr}^{\dagger}\) & Pr \\
\hline \(\backslash\) projlim \({ }^{\dagger}{ }^{\text {a }}\) & proj lim & \sec & sec & \(\backslash\) sin & sin \\
\hline \(\backslash\) sinh & sinh & \(\backslash\) sup \(^{\dagger}\) & sup & \(\backslash\) tan & tan \\
\hline \(\backslash\) tanh & tanh & \(\backslash\) varinjlim \({ }^{\dagger}{ }^{\text {a }}\) & \(\xrightarrow{l i m}\) & \varliminf \({ }^{\dagger}{ }^{\dagger}\) & \(\underline{\text { lim }}\) \\
\hline \(\backslash\) varlimsup \({ }^{\dagger}\) & \(\overline{\mathrm{lim}}\) & \(\backslash\) varprojlim \({ }^{\ddagger}\) & \(\xrightarrow{l}\) & & \\
\hline
\end{tabular}

9 Mathematics
Table 9.6 Modulo Commands ( \({ }^{\ddagger}\) defined by amsmath package)
\begin{tabular}{lll}
\hline Command & Example Input & Example Output \\
\hline\(\backslash\) bmod & \(\$ m \backslash \operatorname{bmod} n \$\) & \(m \bmod n\) \\
\(\backslash \operatorname{pmod}\{\langle\operatorname{maths}\rangle\}\) & \(\$ m \backslash \operatorname{pmod}\{n\} \$\) & \(m(\bmod n)\) \\
\(\backslash \bmod \{\langle\operatorname{maths}\rangle\}^{\ddagger}\) & \(\$ m \backslash \bmod \{n\} \$\) & \(m \bmod n\) \\
\(\backslash \operatorname{pod}\{\langle\operatorname{maths}\rangle\}^{\ddagger}\) & \(\$ m \backslash \operatorname{pod}\{n\} \$\) & \(m(n)\) \\
\hline
\end{tabular}

\section*{Example (Trigonometric Functions):}

This example uses the cos and \(\sin\) functions and also the Greek letter theta.
\(\backslash[\mathrm{z}=\mathrm{r}(\backslash \cos \backslash\) theta \(+\mathrm{i} \backslash \sin \backslash\) theta) \(\backslash]\)
Input
\[
z=r(\cos \theta+i \sin \theta)
\]

Output
Example (Limit):
The command \(\backslash\) infty is the infinity symbol \(\infty\), and the command \(\backslash\) to displays an arrow pointing to the right. Note the use of _ since the limit is a subscript.
\[ \lim_\{x\to\infty\} \(f(x)\) ]

9 Mathematics
\[
\lim _{x \rightarrow \infty} f(x)
\]

The operators with limits behave differently depending on whether they are in displayed or in-line maths. Notice the difference when the same code appears in-line:

In a line of text \(\$ \backslash\) lim_ \(\{x \backslash\) to \(\backslash\) infty \(\} f(x) \$\)
which now displays as:
In a line of text \(\lim _{x \rightarrow \infty} f(x)\)

\section*{Example (With Subscript):}

This is another example of a functional name using a subscript:
\(\backslash\left[\backslash m i n \_x f(x) \\right]\)

Again, notice the difference when it is used in-line:
In a line of text \(\$ \backslash\) min_x \(f(x) \$\)
In a line of text \(\min _{x} f(x)\)

9 Mathematics

\section*{Defining New Functional Operators}

It may be that you want a function that isn＇t specified in Table 9．5．In this case，the amsmath provides the preamble only command
\(\backslash\) DeclareMathOperator \(\{\langle\mathrm{cmd}\rangle\}\{\langle\) operator name \(\rangle\}\)
or its starred variant
\DeclareMathOperator＊\｛〈cmd \(\rangle\}\{\langle\) operator name \(\rangle\}\)
Both versions define a command called \(\langle c m d\rangle\) ，which must start with a backslash，that typesets 〈operator name〉 as a function name．The starred version is for function names that can take limits（like \lim and \(\backslash \mathrm{min}\) de－ scribed above）．

\section*{Example（Operator Without Limits）：}

Suppose I want a function called card，which represents the cardinality of a set \(S\) ．First I need to define the new operator command（which I＇m going to call \card）in the preamble：
\(\backslash\) DeclareMathOperator \(\{\backslash\) card \(\}\) \｛card \}
［FAQ：Defining a new log－like

This operator doesn＇t take any limits，so I have used the unstarred version．

\section*{9 Mathematics}

Later in the document, I can use this new operator command:
\[
\begin{aligned}
\backslash[\mathrm{n}=\backslash \operatorname{card}(\backslash \operatorname{mathcal}\{\mathrm{S}\}) \backslash] & \\
& n=\operatorname{card}(S)
\end{aligned}
\]

In this example \(\backslash\) mathcal is used as sets are typically represented in a calligraphic font.

\section*{Example (Operator With Limits):}

Suppose I now want a function called mode, which represents the mode of a set of numbers. First, I define the operator command in the preamble:
\DeclareMathOperator*\{\mode\} \{mode\}
This operator needs to be able to have a subscript, so I have used the starred version.

Later in the document, I can use this new operator command:
\[ x_m = \mode_\{x \in \mathcal\{S\}\}(x) \]
\[
x_{m}=\underset{x \in S}{\operatorname{mode}(x)}
\]

9 Mathematics

\subsection*{9.4.5 Fractions}

Fractions are created using the command
\(\backslash\) frac \(\{\langle\) numerator \(\rangle\}\{\langle\) denominator \(\rangle\}\)
The amsmath package also provides the command
\(\backslash c f r a c[\langle p o s\rangle]\{\langle\) numerator \(\rangle\}\{\langle\) denominator \(\rangle\}\)
which is designed for continued fractions. The optional argument pos can be used for left ( 1 ) or right ( \(r\) ) placement of any of the numerators. (The default is centred.)

\section*{Example:}

A simple fraction:
\(\backslash[\backslash f r a c\{1\}\{1+x\} \backslash]\)
Produces:
\[
\frac{1}{1+x}
\]

Compare with:

9 Mathematics
In-line: \$ \(\backslash\) frac \(\{1\}\{1+\mathrm{x}\}\) \$
which produces:
In-line: \(\frac{1}{1+x}\)
Example (Nested):
\(\backslash\left[\backslash\right.\) frac \(\{1+\backslash\) frac \(\left.\{1\}\{x\}\}\left\{1+\mathrm{x}+\mathrm{x}^{\wedge} 2\right\} \backslash\right] \quad\) Input
\[
\frac{1+\frac{1}{x}}{1+x+x^{2}}
\]

\section*{Example (Continued Fraction);}

A continued fraction (example taken from amsmath documentation and uses \sqrt, described in Section 9.4.6, and \dotsb, described in Section 9.4.7):

9 Mathematics
\[
\frac{1}{\sqrt{2}+\frac{1}{\sqrt{2}+\frac{1}{\sqrt{2}+\cdots}}}
\]

Example (A Derivative):
\[ \(\mathrm{f}^{\prime}(\mathrm{x})=\) \frac\{df\}\{dx\} \]
\[
f^{\prime}(x)=\frac{d f}{d x}
\]

As with " e ", the differential operator " d " should be in an upright font as it is not a variable:

f'(x) = \frac{\mathrm{d}f}{\mathrm{d}x}

$$
f^{\prime}(x)=\frac{\mathrm{d} f}{\mathrm{~d} x}
$$

The above example is rather cumbersome, particularly if you have a lot of derivatives, so it might be easier to define a new command (see Chapter 8 (Defining Commands)). In the preamble define:
\newcommand\{\deriv\}[2]\{\frac\{\mathrm\{d\}\#1\}\{\mathrm\{d\}\#2\}\}
Then in the document:
$\backslash\left[f^{\prime}(x)=\backslash \operatorname{deriv}\{f\}\{x\}\right.$ \]

$$
f^{\prime}(x)=\frac{\mathrm{d} f}{\mathrm{~d} x}
$$

 Example (Partial Derivative):

Partial derivatives can be obtained similarly using the command $\backslash$ partial to display the partial derivative symbol. As in the previous example, first define a new command to format a partial derivative in the preamble:
\newcommand\{\pderiv\}[2]\{\frac\{\partial \#1\}\partial \#2\}
Then in the document:

9 Mathematics
$\backslash[\mathrm{f}$ _x $=\backslash \operatorname{pderiv}\{\mathrm{f}\}\{\mathrm{x}\} \backslash]$

$$
f_{x}=\frac{\partial f}{\partial x}
$$

Example (Double Partial Derivative):

Example (First principles):

9 Mathematics

$$
f^{\prime}(x)=\lim _{\Delta x \rightarrow 0} \frac{f(x+\Delta x)-f(x)}{\Delta x}
$$

 9.4.6 Roots

Roots are obtained using the command
$\backslash$ sqrt $[\langle$ order $\rangle]\{\langle$ maths $\rangle\}$
without the optional argument $\langle$ order $\rangle$ it will produce a simple square root. Cubic roots etc can be obtained using the optional argument.

 Examples:

1 A square root:
$\backslash[\backslash \operatorname{sqrt}\{a+b\} \backslash]$
Input

Output

9 Mathematics
2. A cubic root:

$$
\backslash[\backslash \text { sqrt [3] }\{a+b\} \backslash]
$$

Input

$$
\sqrt[3]{a+b}
$$

3 An $n$th root:
$\backslash[\backslash \operatorname{sqrt}[n]\{a+b\} \backslash]$
Input
Output
$\sqrt[n]{a+b}$

 9.4.7 Mathematical Symbols

Relational symbols are shown in Table 9.7. If you want a negation that is not shown, you can obtain it by preceding the symbol with the command $\backslash$ not. For example: $\backslash$ not $\backslash$ subset produces the symbol $\not \subset$.

Binary operator symbols are shown in Table 9.8, and arrow symbols are shown in Table 9.9. There are also over and under arrows (Table 9.10) that have an argument. The over arrows put an extendible arrow over

$$
\text { Previous Next First Last Back Forward Summary Index } 333
$$

[FAQ: Where can I find the symbol for ...]

| $\backslash$ bigoplus | $\oplus$ | $\backslash$ biguplus | $\biguplus$ |  |  |

 9 Mathematics

Symbols that can have limits are shown in Table 9.11. The size of these symbols depends on whether they are in displayed maths or in-line maths.

 Example (Displayed Summation and Product):

The limits of summations and products are placed above and below the symbol in displayed maths:

$$
f(x)=\sum_{i=1}^{n} x_{i}+\prod_{i=1}^{n} x_{i}
$$

 Example (In-line Summation and Product):

The limits of summations and products are placed to the right of the symbol in in-line maths:

9 Mathematics

In a line of text:
\begin\{math\} }
$f(x)=\backslash$ sum_\{i=1\}^\{n\} $x \_i+\backslash p r o d \_\{i=1\}^{\wedge}\{n\} x_{-} i$
\end\{math\} }

In a line of text: $f(x)=\sum_{i=1}^{n} x_{i}+\prod_{i=1}^{n} x_{i}$

 Multiline Sub- or Superscripts

The amsmath package provides the command:
\substack \{ $\langle$ maths $\rangle\}$
which can be used for multiline sub- or superscripts. Within the argument <maths use $\backslash \backslash$ to separate rows. For example:

 9 Mathematics

i \in \mathcal{I}\\
i \neq 0
}
}
x_i
\]

$\sum_{\substack{i \in \mathscr{G} \\ i \neq 0}} x_{i}$

 9.4.8 Ellipses

Ellipsis (omission mark) commands are shown in Table 9.12. The amsmath package also provides: \dotsc for dots with commas, \dotsb for dots with binary operators/relations, \dotsm for multiplication dots, \dotsi for dots with integrals and \dotso for other dots, which can be used as replacements for ··· and \cdots.

9 Mathematics
Table 9.12 Ellipses ( ${ }^{\dagger}$ provided by amsmath package)

| $\backslash$ vdots | $\vdots$ | $\backslash$ cdots | $\ldots$ | $\backslash$ dotsb $^{\dagger}$ | $\ldots$ | $\backslash \operatorname{dotsi}^{\dagger}$ | $\ldots$ | $\backslash \operatorname{dotsm}^{\dagger}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\backslash$ ddots | $\ddots$ | $\backslash$ dots | $\ldots$ | $\backslash$ dotsc $^{\dagger}$ | $\ldots$ | $\backslash \operatorname{dotso}^{\dagger}$ | $\ldots$ |  |

 Example (Low Ellipsis):

This example uses the command $\backslash$ forall to produce the "for all" symbol $\forall$, and it also uses $\_{\lrcorner}$(backslash space) to make a space before the for all symbol. The amsmath "dots with commas" ellipsis \dotsc is used rather than the standard $\backslash$ ldots:

$$
a_{i} x_{i}=b_{i} \forall i=1, \ldots, n
$$

9 Mathematics

 Example (Centred ellipsis):

This example use the amsmath "dots with binary operators/relations" \dotsb instead of the standard \cdots:

 Exercise 22 (Maths: Fractions and Symbols)

This exercise uses a fraction, a square root, subscripts, superscripts and symbols. Try to reproduce the following output:

The quadratic equation

$$
\sum_{i=0}^{2} a_{i} x^{i}=0
$$

 9 Mathematics

has solutions given by

$$
x=\frac{-a_{1} \pm \sqrt{a_{1}^{2}-4 a_{2} a_{0}}}{2 a_{2}}
$$

Again you can download or view the solution.

 9.4.9 Delimiters

Placing brackets around a tall object in maths mode, such as fractions, does not look right if you use normal sized brackets. For example:

results in:

9 Mathematics

$$
\left(\frac{1}{1+x}\right)
$$

Instead, you can automatically resize the delimiters using the commands:
$\backslash l e f t\langle$ delimiter $\rangle$
and
$\backslash$ right $\langle$ delimiter $\rangle$
Rewriting the above example:

produces:

$$
\left(\frac{1}{1+x}\right)
$$

 9 Mathematics

Note that you must always have matching \left and $\backslash$ right commands, although the delimiters used may be different. If you want one of the delimiters to be invisible, use a . (full stop) as the delimiter. Available delimiters are shown in Table 9.13. (Note for a vertical bar delimiter it's best to use amsmath's \lvert command instead of | and \lVert instead of \।.) Sometimes using \left and \right doesn't produce the optimal sized delimiters. In which case you can use additional commands provided by the amsmath package shown in Table 9.14.

Table 9.13 Delimiters ( ${ }^{\dagger}$ defined by amsmath)

Example (Vertical Bar Delimiters):

9 Mathematics

Table 9.14 Additional Commands Provided by amsmath for Delimiter Sizing

| Definitions |  | Example |  |
| :---: | :---: | :---: | :---: |
| Def | t Size | \$ ( X ) \$ | (X) |
| \bigl $\langle$ delim $\rangle$ | $\backslash \mathrm{bigr}\langle$ delim $\rangle$ | \$\bigl( X \bigr)\$ | (X) |
| $\backslash$ Bigl $\langle$ delim $\rangle$ | $\backslash$ Bigr $\langle$ delim $\rangle$ | \$\Bigl( X \Bigr)\$ | (X) |
| \biggl $\langle$ delim $\rangle$ | \biggr〈delim> | \$\bigl( X \biggr)\$ | (X) |
| \Biggl〈delim> | $\backslash$ Biggr $\langle$ delim $\rangle$ | \$\Biggl( X \Biggr)\$ | $(X)$ |

9 Mathematics

\
\left\lvert
\frac{1}{1+x}
\right\rvert
\]
\[
\left|\frac{1}{1+x}\right|
\]

\section*{Example (Delimiter with Subscript):}

Delimiters can take limits:
\[
\left } \backslash \text { lvert }
\(\backslash f r a c\{1\}\{1+x\}\)
\right } \backslash \text { rvert_\{ } \mathrm { x } = 0 \text { \} }
\]

9 Mathematics

\section*{Example (Mismatch):}

The left and right delimiters don't have to match:

\section*{Example (An invisible delimiter):}

Every \right must have a matching \left (and vice versa), so use a . (full stop) for an invisible delimiter.
\[
\left.
\frac{\partial f}{\partial x}
\right\rvert_{x=0}
\]

9 Mathematics

$$
\left.\frac{\partial f}{\partial x}\right|_{x=0}
$$

We have now covered enough to reproduce the equation shown in Chapter 1 (Introduction):

\newcommand*{\pderiv}[2]{\frac{\partial #1}{\partial #2}}
\newcommand*{\e}{\mathrm{e}}
\[
\pderiv{^2\mathcal{L}}{{z_i^\rho}^2} =
-\pderiv{\rho_i}{z_i^\rho}
\left(
\pderiv{v_i}{\rho_i} \frac{\e^{v_i}}{1-\e^{v_i}}
+ v_i \frac{\e^{v_i}\pderiv{v_i}{\rho_i}(1-\e^{v_i})
+\e^{2v_i}\pderiv{v_i}{\rho_i}}{(1-\e^{v_i})^2}
\right)
\]
\[
\frac{\partial^{2} \mathscr{L}}{\partial z_{i}^{\rho 2}}=-\frac{\partial \rho_{i}}{\partial z_{i}^{\rho}}\left(\frac{\partial v_{i}}{\partial \rho_{i}} \frac{\mathrm{e}^{v_{i}}}{1-\mathrm{e}^{v_{i}}}+v_{i} \frac{\mathrm{e}^{v_{i}} \frac{\partial v_{i}}{\partial \rho_{i}}\left(1-\mathrm{e}^{v_{i}}\right)+\mathrm{e}^{2 v_{i}} \frac{\partial v_{i}}{\partial \rho_{i}}}{\left(1-\mathrm{e}^{v_{i}}\right)^{2}}\right)
\]

\section*{Note:}

The above code looks a bit complicated, and there are so many braces that it can be easy to lose track, so here are some ways of making it a little easier to type:
1. Whenever you start a new environment type in the \begin and \(\backslash\) end bits first, and then insert whatever goes inside the environment. This ensures that you always have a matching \begin and \end. The same goes for \(\backslash[\) and \(\backslash]\).
2. Whenever you type any braces, always type the opening and closing braces first, and then insert whatever goes in between. This will ensure that your braces always match up.

So keeping these notes in mind, let's try typing in the code in a methodical manner:

9 Mathematics
1. Start and end the displayed maths mode:

2. We now need a partial derivative. (The command \(\backslash\) pderiv is defined as described earlier. Make sure you remember to define it, preferably in the preamble.)

3. Let's do the first argument. This partial derivative is actually a double derivative, which means we need a squared bit on the top along with a calligraphic L:

9 Mathematics
4. The second argument is the \(z_{i}^{\rho}\) squared bit. This is a nested superscript \(\left\{z_{-} i^{\wedge} \backslash \text { rho }\right\}^{\wedge} 2\) :

5. We can do the next partial derivative in the same way. This one is slightly easier to do:

9 Mathematics

6. Delimiters also need to occur in pairs, like curly braces and \(\backslash\) begin and \end, so let's do them next:

7. Now we need to do the bits inside the brackets. First of all we have yet another partial derivative:

\ \ Input
\pderiv{^2 \mathcal{L}}{{z_i^\rho}^2} =
-\pderiv{\rho_i}{z_i^\rho}
\left(
\pderiv{v_i}{\rho_i}
\right)
\]

L
8. Now we have a fraction following the partial derivative from the previous step. (Make sure you use braces for the exponential bit: $\backslash e^{\wedge}\left\{v_{-} i\right\}\left(e^{v_{i}}\right)$ is not the same as $\backslash e^{\wedge} v_{-} i\left(e_{i}^{V}\right)$. The command $\backslash e$ is defined as described earlier in Section 9.4.3. Make sure you define it, preferably in the preamble.)

9 Mathematics

\ 个 Input
\pderiv{^2 \mathcal{L}}{{z_i^\rho}^2} =
-\pderiv{\rho_i}{z_i^\rho}
\left(
\pderiv{v_i}{\rho_i} \frac{\e^{v_i}}{1-\e^{v_i}}
\right)
\]
9. This is followed by \(v_{i}\) times another fraction:

\ \Input

\[
\pderiv{^2 \mathcal{L}}{{{z_i^\rho}^2} =
-\pderiv{\rho_i}{z_i^\rho}
\left(
\pderiv{v_i}{\rho_i} \frac{\e^{v_i}}{1-\e^{v_i}}
1 v_i \frac{}{}
\right)

9 Mathematics
$\square$
$\llcorner$
10. The bottom part of the fraction (the denominator) is easier than the top, so let's do that first:

堷 Input
\pderiv{^2 \mathcal{L}}{{z_i^\rho}^2} =
-\pderiv{\rho_i}{z_i^\rho}
\left(
\pderiv{v_i}{\\rho_i} \frac{\e^{v_i}}{1-\e^{v_i}}
+ v_i \frac{}{(1-\e^{v_i})^2}
\right)
\]

11. Now for the top part of the fraction (the numerator). To refresh your memory, it should look like:

$$
\mathrm{e}^{v_{i}} \frac{\partial v_{i}}{\partial \rho_{i}}\left(1-\mathrm{e}^{v_{i}}\right)+\mathrm{e}^{2 v_{i}} \frac{\partial v_{i}}{\partial \rho_{i}}
$$

9 Mathematics

That's a bit complicated, so let's break it down:
a) The first term is:
\e^\{v_i\}
b) The next term is another partial derivative:

\pderiv{v_i}{\rho_i}

c) Then we have:
(1-\e^\{v_i\})
d) Next we have to add on:
$+\backslash e^{\wedge}\{2 \mathrm{v}$ _i $\}$
e) And finally we have:

$$
\text { \pderiv\{v_i\}\{\rho_i\} }
$$

So the numerator is:

9 Mathematics
$\backslash e^{\wedge}\left\{v_{1} i\right\} \backslash p d e r i v\left\{v_{1} i\right\}\{\backslash$ rho_i $\}\left(1-\backslash e^{\wedge}\left\{v_{1} i\right\}\right)$
$+\backslash e^{\wedge}\left\{2 v \_i\right\} \backslash p d e r i v\left\{v^{\prime} \_i\right\}\{\backslash$ rho_i $\}$
Inserting this into our code:

$$
\[
\pderiv{^2\mathcal{L}}{{z__i^\rho}^2} =
\pderiv{^2\mathcal{L}}{{z__i^\rho}^2} =
-\pderiv{\rho_i}{z_i^\rho}
-\pderiv{\rho_i}{z_i^\rho}
\left(
\left(
\pderiv{v_i}{\rho_i} \frac{\e^{v_i}}{1-\e^{v_i}}
\pderiv{v_i}{\rho_i} \frac{\e^{v_i}}{1-\e^{v_i}}
+ v_i \frac{\e^{v_i}\pderiv{v_i}{\\rho_i}(1-\e^{v_i})
+ v_i \frac{\e^{v_i}\pderiv{v_i}{\\rho_i}(1-\e^{v_i})
+\e^{2v_i}\pderiv{v_i}{\\rho_i}}{(1-\e^{v_i})^2}
+\e^{2v_i}\pderiv{v_i}{\\rho_i}}{(1-\e^{v_i})^2}
\right)
\right)
$$

\]

9 Mathematics

 9.4.10 Arrays

Mathematical structures such as matrices and vectors require elements to be arranged in rows and columns. Just as we can align material in rows and columns in text mode using the tabular environment (Section 4.6), we can do the same in maths mode using the array environment. The array environment has the same format as the tabular environment, however it must be in maths mode. The column half-gaps are given by the length register $\backslash$ arraycolsep (analogous to $\backslash$ tabcolsep).

 Example:

\
\begin{array}{rrr}
0 & 1 & 19\\
-6 & 10 & 200
\end{array}
\]

9 Mathematics

Example (Adding Delimiters):

\
\left(
$$
\begin{array}{rrr}
O & 1 & 19\\
-6 & 10 & 200
\end{array}
$$
\right)
\]

$$
\left(\begin{array}{rrr}
0 & 1 & 19 \\
-6 & 10 & 200
\end{array}\right)
$$

9 Mathematics

 Adding a Vertical Rule:

A vertical rule can be added using | in the column specifier. For example:

$$
\left(
\begin{array}{rr|r}
O & 1 & 19\\
-6 & 10 & 200
\end{array}
\right)
$$

$$
\left(\begin{array}{rr|r}
0 & 1 & 19 \\
-6 & 10 & 200
\end{array}\right)
$$

 Example (Cases):

This example uses an invisible delimiter:

9 Mathematics

$$
\(f(x)=\)
```
\left\{
```
\(\backslash\) begin\{array\}\{rl\}
\(-1 \& x<0 \backslash \backslash\)
0 \& \(x=0 \backslash \backslash\)
\(+1 \& x>0\)
\end\{array\} }
\(\backslash\) right.
$$

$$
f(x)=\left\{\begin{array}{rl}
-1 & x<0 \\
0 & x=0 \\
+1 & x>0
\end{array}\right.
$$

This can be rewritten more compactly using the amsmath cases environment:

9 Mathematics

\[
f(x) =
\begin{cases}
-1 & x < 0\\
0 & x = 0\\
+1 & x > 0
\end{cases}
\]
\[
f(x)= \begin{cases}-1 & x<0 \\ 0 & x=0 \\ +1 & x>0\end{cases}
\]

The amsmath package provides some convenient environments to typeset matrices: pmatrix, bmatrix, Bmatrix, vmatrix and Vmatrix. These are similar to the array environment except there is no argument, and they add (respectively) ( ), [ ], \{ \}, || and \|\| delimiters. There is also the matrix environment that doesn't have any delimiters.

9 Mathematics

\section*{Example:}

The amsmath package also provides the environment smallmatrix designed for in-line use. You need to add any delimiters explicitly.

9 Mathematics

\section*{Example:}
Here is a small matrix
\begin{math}
\left(
\begin{smallmatrix}
a & b\\
c & d
\end{smallmatrix}
\right)
\end{math}
in a line of text.

Here is a small matrix $\left(\begin{array}{ll}a & b \\ c & d\end{array}\right)$ in a line of text.

 9.4.11 Vectors

A variable representing a vector can be typeset using the command:
$\backslash \operatorname{vec}\{\langle$ variable $\rangle\}$

9 Mathematics

 Example:

$\backslash[\backslash \operatorname{vec}\{\mathrm{x}\}$ \]

Input

Output
Vectors are often typeset in bold. This can be done by redefining the \vec command. You could use \mathbf, for example:

$$
\mathbf{x} \cdot \xi=z
$$

However, as you may have noticed, the Greek letter $\xi$ has not come out in bold. Here's an alternative (using \boldsymbol defined in the amsfonts package):

 9 Mathematics

\renewcommand{\vec}[1]{\boldsymbol{#1}}
\[
\vec{x}\cdot\vec{\xi} = z
\]

$$
x \cdot \xi=z
$$

Located (or position) vectors, on the other hand, are usually typeset with a right arrow, but the default definition of $\backslash \mathrm{vec}$ produces an arrow that is too small:
$\backslash[\backslash \operatorname{vec}\{O P\} \backslash]$

 $\overrightarrow{O P}$

Instead, use \overrightarrow (Table 9.10):

$$
\overrightarrow\{OP\}
$$

$$
\overrightarrow{O P}
$$

You might prefer to define separate commands for a located vector and a vector variable.

9 Mathematics

 Example:

In the preamble, define $\backslash$ lvec for a located vector and $\backslash$ bvec for a vector variable:
\newcommand*\{\lvec\}[1]\{\overrightarrow\{\#1\}\}
\newcommand*\{\bvec\}[1]\{\boldsymbol\{\#1\}\}

Later in the document:

Let $\bvec{u}=(x, y)$ represent $\lvec{OP}$, then
\[
\lVert \bvec{u} \rVert = \sqrt{x^2 + y^2}
\]

Let $\boldsymbol{u}=(x, y)$ represent $\overrightarrow{O P}$, then

$$
\|\boldsymbol{u}\|=\sqrt{x^{2}+y^{2}}
$$

9 Mathematics

 Exercise 23 (Maths: Vectors and Arrays)

Try to produce the following:

As before, you can download or view the solution.

 9.4.12 Mathematical Spacing

LATEX deals with mathematical spacing fairly well, but sometimes you may find you want to adjust the spacing yourself. Available spacing commands are listed in Table 9.15.

Table 9.15 Mathematical Spacing Commands ( ${ }^{\dagger}$ provided by amsmath)

| Command | Example Input | Example Output |
| :--- | :--- | :--- |
|  | $\$ A B \$$ | $A B$ |
| \thinspace or $\backslash$, | $\$ A \backslash, B \$$ | $A B$ |
| $\backslash$ medspace ${ }^{\dagger}$ or $\backslash:$ | $\$ A \backslash: B \$$ | $A B$ |
| \thickspace ${ }^{\dagger}$ or $\backslash ;$ | $\$ A \backslash ; B \$$ | $A B$ |
| \quad | $\$ A \backslash$ quad $B \$$ | $A$ |
| \qquad | $\$ A \backslash$ qquad $B \$$ | $A$ |
| \negthinspace or $\backslash!$ | $\$ A \backslash!B \$$ | $A B$ |
| \negmedspace ${ }^{\dagger}$ | $\$ A \backslash$ negmedspace $B \$$ | $A B$ |
| negthickspace $^{\dagger}$ | $\$ A \backslash$ negthickspace $B \$$ | $A B$ |

9 Mathematics

 Exercise 24 (More Mathematics)

This exercise uses the spacing command \qquad. In addition, it has a function name, diag, and it uses the $\backslash$ forall and ellipses symbols. It also redefines the \vec command, as was done in the previous section, uses the bmatrix environment (see Section 9.4.10), and has subscripts and superscripts.

Try to reproduce the following output:

The set of linear equations:

$$
a_{i} x_{i}=b_{i} \quad \forall i=1, \ldots, n
$$

can be written as a matrix equation:

$$
\operatorname{diag}(\boldsymbol{a}) \boldsymbol{x}=\boldsymbol{b}
$$

where $\boldsymbol{x}=\left(x_{1}, \ldots, x_{n}\right)^{T}, \boldsymbol{b}=\left(b_{1}, \ldots, b_{n}\right)^{T}$ and

$$
\operatorname{diag}(\boldsymbol{a})=\left[\begin{array}{cccc}
a_{1} & 0 & \cdots & 0 \\
0 & a_{2} & \ddots & \vdots \\
\vdots & \ddots & \ddots & 0 \\
0 & \cdots & 0 & a_{n}
\end{array}\right]
$$

9 Mathematics

Again, you can download or view the solution.

 10．Defining Environments

Just as you can define new commands，you can also define new environ－ ments．The command
$\backslash$ newenvironment $\{\langle$ env－name $\rangle\}[\langle$ n－args $\rangle][\langle$ default $\rangle]\{\langle$ begin－code $\rangle\}$ \｛〈end－code〉\}
is used to define a new environment．As with new commands，you can use the optional argument $\langle n$－args $\rangle$ to define an environment with arguments， and $\langle$ default $\rangle$ to define an environment with an optional argument．

The first argument 〈env－name〉 is the name of your new environment． Remember that the environment name must not have a backslash．The mandatory arguments $\langle$ begin－code $\rangle$ and $\langle$ end－code〉 indicate what EATEX should do at the beginning and end of the environment．Note that although〈begin－code〉 can reference the arguments using \＃1 etc，the 〈end－code〉 part can＇t．

 10 Defining Environments

 Example (An Exercise Environment):

Let's first consider an example of an environment without any arguments. Let's make an environment called, say, exercise that prints Exercise in bold and typesets the contents of the environment in italic, with a gap between the title and the contents. In other words, we want the following code:

\begin{exercise}
This is a sample.
\end{exercise}
to produce the following output:
Exercise \begin{tabular}{|c} 
\\
Output
\end{tabular}

This is a sample.
(In the next chapter we will add numbering.)
Let's first consider what we want this environment to do: we can get the word "Exercise" in bold using \textbf, and the italic font can be obtained by using the itshape environment (recall Section 4.5). So, at the start of our new environment we need

10 Defining Environments
\textbf\{Exercise\}\begin\{itshape\} }
and at the end of our new environment we need to end the itshape environment:
\end\{itshape\} }
Putting the above together into the new environment definition:

\newenvironment{exercise}% environment name
{% begin code
**Exercise**$$
\begin{itshape}%
}%
{\end{itshape}
$$}% end code

Let's try it out:
$\backslash$ begin $\{$ exercise $\}$
This is a sample.
\end\{exercise\} }

Exercise This is a sample.
Not quite right. Let's put a paragraph break after Exercise, and put one before it as well. The command $\backslash$ par can be used to make a paragraph break and the extra bit of vertical spacing can be produced using \vspace. The length $\backslash$ baselineskip is the interline spacing. Modifications are shown in bold like this.

\newenvironment{exercise}% environment name
{% begin code
\par\vspace{\baselineskip}%
\textbf{Exercise}\begin{itshape}%
\par\vspace{\baselineskip}%
}%
{\end{itshape}}% end code

Let's have a look at the output now:

\section*{10 Defining Environments}

\section*{Exercise}

This is a sample.

The indent at the start of each line is caused by the normal paragraph indentation. This can be suppressed using \noindent. It's also a good idea to suppress any spaces immediately following \begin\{exercise\} and } \end\{exercise\}, which can be done using \ignorespaces and } \ignorespacesafterend. Modifications are again shown in bold like this.
[FAQ: There's a
space added after my environment]
\newenvironment\{exercise\}\% environment name
\{\% begin code
\par\vspace\{\baselineskip\}\noindent
\textbf\{Exercise\}\begin\{itshape\}\% }
\par\vspace\{\baselineskip\}\noindent\ignorespaces
\}\%
\{\% end code
\end\{itshape\}\ignorespacesafterend }
\}

\section*{10 Defining Environments}

The exercise environment now appears as:

Now let's modify our code so that the environment takes an argument. The argument should indicate the exercise topic. For example, the following code:

begin{exercise}{An Example}
This is a sample.
\end{exercise}

\begin\{exercise\}\{An Example\} } This is a sample. \end\{exercise\} }

\(\qquad\) \(\perp\)

\section*{Exercise}

This is a sample.
should produce the following result:

10 Defining Environments

\section*{Exercise (An Example)}

This is a sample.

As with \newcommand, \#1 is used to indicate the first argument. We can now modify the code as follows:

\newenvironment{exercise}[1]% environment name
{% begin code
\par\vspace{\baselineskip}\noindent
**Exercise (\#1)**$$
\begin{itshape}%
\par\vspace{\baselineskip}\noindent\ignorespaces
}%
{% end code
\end{itshape}
$$\ignorespacesafterend
}

 10 Defining Environments

 10.1 Redefining Environments

It is also possible to redefine an environment using:
$\backslash$ renewenvironment $\{\langle$ env-name $\rangle\}[\langle n$-args $\rangle][\langle$ default $\rangle]\{\langle$ begin-code $\rangle\}$ \{〈end-code〉\}

As with 

 Exercise 25 (Defining a New Environment)

If you did any of the exercises from Exercise 10 to Exercise 17, go back to the document you created and define the exercise environment as in the example above. Then try creating some exercises using this environment. You could, maybe, put an exercise in the first chapter, and then another one in the second chapter. Again you can download or view an example.

 11. Counters

As we have seen, $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ automatically generates numbers for chapters, sections, equations etc. These numbers are stored in counters. The names of these counters are usually the same as the name of the object with which it is associated but without any backslash. For example, the \chapter command has an associated counter called chapter, the \footnote command has an associated counter called footnote, the equation environment has an associated counter called equation, the figure environment has an associated counter called figure and the table environment has an associated counter called table. There is also a counter called page that keeps track of the current page number.

The value of a counter can be displayed using the command
\the $\langle$ counter〉
where $\langle$ counter $\rangle$ is the name of the associated counter. Note that $\langle$ counter $\rangle$ does not go in curly braces and adjoins \the (for example, \thepage, \thesection or \thechapter). In fact, we have already encountered

 11 Counters

\thefigure in Section 7．4．
Example：

This page is Page $\backslash$ thepage． The current chapter is Chapter～\thechapter．

This page is Page 383．The current chapter is Chapter 11.
New counters can be created using the command：
\newcounter\｛〈counter－name $\rangle\}$［〈outer－counter $\rangle$ ］
The mandatory argument 〈counter－name〉 is the name of your new counter （no backslash in the name）．For example，let＇s define a counter called exercise to keep track of each exercise．（Recall the exercise example from Chapter 10 （Defining Environments）．）
\newcounter \｛exercise\}

 11 Counters

We can now display the value of the counter using the command $\backslash$ theexercise. At the moment the counter has the value zero, the value can be changed using one of the following commands:
\stepcounter $\{\langle$ counter $\rangle\} \quad$ Increments $\langle$ counter $\rangle$ by 1
$\backslash r e f s t e p c o u n t e r\{\langle$ counter $\rangle\} \quad$ As above, but allows you to cross-reference the counter using $\backslash$ label and $\backslash$ ref
\setcounter $\{\langle$ counter $\rangle\}\{\langle$ num $\rangle\}$ Sets the counter to $\langle$ num $\rangle$
$\backslash$ addtocounter $\{\langle$ counter $\rangle\}\{\langle$ num $\rangle\}$ Adds $\langle$ num $\rangle$ to $\langle$ counter $\rangle$
A couple of the commands above take a number $\langle$ num $\rangle$ as one of the arguments. If you want to use another counter for this argument, you need to use
\value $\{\langle$ counter $\rangle\}$
For example, if you want to set our new exercise counter to the same value as the page counter, you would do
\setcounter\{exercise\}\{\value\{page\}\}

 11 Counters

Let's go back to the exercise environment you created in Exercise 25. The exercises really ought to have an associated number, and this number should be incremented each time we use the exercise environment. So let's modify our code to do this. Modifications are illustrated in bold like this:

\newcounter{exercise}
\newenvironment{exercise}[1]% environment name
{% begin code
\par\vspace{\baselineskip}\noindent
\refstepcounter{exercise}%
\textbf{Exercise \theexercise\ь(#1)}%
\begin{itshape}%
\par\vspace{\baselineskip}%
\noindent\ignorespaces
}%
{% end code
\end{itshape}%
\par\vspace{\baselineskip}%
\noindent\ignorespacesafterend
}

 11 Counters

Note that the counter needs to be incremented before it is used. I've also added an extra \vspace at the end of the environment and a paragraph break. Since we've used $\backslash$ refstepcounter instead of $\backslash$ stepcounter we can cross-reference our exercise environment:
Exercise~[ex:simple](#ex:simple) is a simple exercise.
$$
\begin{exercise}{Simple Exercise}
\label{ex:simple}%
This is a simple exercise.
\end{exercise}
$$

This produces the following output:

Exercise 1 is a simple exercise.

\section*{Exercise 1 (Simple Exercise)}

This is a simple exercise.

\section*{11 Counters}

The counter representation can be changed by redefining \(\backslash\) theexercise using the \(\backslash\) renewcommand command described in Section 8.2. The following commands can be used to display the counter:
[FAQ: Redefining
\(\backslash\) arabic \(\{\langle\) counter \(\rangle\} \quad\) Arabic numeral (1, 2, 3, ...)
\(\backslash\) Roman \(\{\langle\) counter \(\rangle\} \quad\) Upper case Roman numeral (I, II, III, ...)
\(\backslash\) roman \(\{\langle\) counter \(\rangle\} \quad\) Lower case Roman numeral ( \(\mathrm{i}, \mathrm{ii}, \mathrm{iii}, \ldots\) )
\alph \(\{\langle\) counter \(\rangle\} \quad\) Lower case letter ( \(\mathrm{a}, \mathrm{b}, \mathrm{c}, \ldots, \mathrm{z}\) )
\(\backslash\) Alph \(\{\langle\) counter \(\rangle\} \quad\) Upper case letter (A, B, C, ..., Z)
\fnsymbol \(\{\langle\) counter \(\rangle\) \} A footnote symbol \((* † \ddagger \S \mathbb{T} \| * * \dagger \dagger \ddagger)\)

\section*{Example:}

To make the chapter numbers appear as upper case Roman numerals you would do:
\renewcommand\{\thechapter\}\{\Roman\{chapter\}\}
You may have noticed that \(\backslash\) newcounter has an optional argument <outercounter \(\rangle\). This is for use if you require the new counter to be reset every

\section*{11 Counters}
time \(\langle\) outer-counter \(\rangle\) is incremented. For example, the section numbers in the scrbook class are dependent on the chapter numbers. Each time a new chapter is started, the section numbers are reset. Suppose we want our exercise counter to be dependent on the chapter counter, we would do
\newcounter \{exercise\} [chapter]
Note that if you make a counter dependent on another counter like this, the default action of \the〈counter〉 remains the same, so \theexercise won't print the chapter number. To make the chapter number appear as well, we need to redefine \(\backslash\) theexercise (recall Section 8.2):
\(\backslash\) renewcommand\{\theexercise\} \(\{\backslash\) thechapter. \(\backslash\) arabic \(\{\) exercise\} \}
Notice the use of \thechapter instead of, say, \arabic\{chapter\}. This way we don't need to keep track of the chapter counter format.

\section*{Example (Footnote Markers):}

The footnote counter is reset at the start of each chapter but by default the chapter number isn't displayed in \thefootnote. In this book \(\backslash\) thefootnote was redefined so that it displays the chapter number:
\renewcommand\{\thefootnote\}\{\thechapter. \(\backslash\) arabic \(\{\) footnote \(\}\) \}
[FAQ: Master and
slave counters]

Input

\section*{11 Counters}

\section*{Exercise 26 (Using Counters)}

Modify the document from Exercise 25 so that the exercise environment has a counter. Make the counter dependent on the chapter. You can download or view an example.

\section*{A. Downloading and Installing Packages}

New \({ }^{E T} \mathrm{~T}_{\mathrm{E}} \mathrm{X}\) packages are being created all the time, so you may find that there are some packages that you don't have on your installation. In this case, if you don't have the package you want, you can download it from CTAN [1]. Before discussing installing new packages, it is a good idea for you to understand the TEX Directory Structure (TDS).

All the files that make up the \(\mathrm{T}_{\mathrm{E}} \mathrm{X}\) distribution are stored in a standard hierarchical structure. The root directory of the main distribution is usually called texmf or texmf-dist. Its location depends on your system. For example, if you are using TeX Live 2012 on UNIX/Linux, it will probably be located in /usr/local/texlive/2012/texmf-dist or if you are using MiKTeX it may be located in c: \texmf or c: \Program Files \(\backslash t e x m f\). Whichever system you are using, I shall refer to this directory as \(\langle T E X M F\rangle\). So, if you are using TeX Live 2012, 〈TEXMF〉/doc refers to the directory /usr/local/ texlive/2012/texmf-dist/doc, or if you are using MiKTeX, \(\langle T E X M F\rangle \backslash\) doc refers to the folder \(\mathrm{c}: \backslash\) texmf \(\backslash\) doc or \(\mathrm{c}: \backslash\) Program Files \(\backslash\) texmf \(\backslash\) doc. In general, you should not make any modifications to the \(\langle T E X M F\rangle\) directory tree as it will get overridden whenever you update your \(\mathrm{T}_{\mathrm{E}} \mathrm{X}\) distribution.
[FAQ: Installing
things on a
(La) TeX system]
[FAQ: Installation using MiKTeX
package manager]
[FAQ: What is the TDS?]

\section*{A Downloading and Installing Packages}

You should also have a local texmf tree. Again, the location of the local texmf tree depends on your system. If you are using TeX Live, it may be /usr/local/texlive/texmf-local. If you are using MiKTeX, it may be
 are using, I shall refer to this directory as \(\langle T E X M F-L O C A L\rangle\). There is also the \(\langle T E X M F-H O M E\rangle\) directory. On UNIX-like systems this is usually \(\sim / t e x m f\). On Windows it's usually in your user folder. This is the one where you typically install any new classes or packages.

These directories must all have the same structure. The principle subdirectories relating to \(\mathrm{ET}_{\mathrm{E}} \mathrm{X}\) are illustrated in Figure A.1. It may be that your \(\langle T E X M F-H O M E\rangle\) directory doesn't exist or doesn't contain some of these sub-directories, if so, you will need to create them.

You can use the kpsewhich application to find out the locations of \(\langle T E X M F\) \(L O C A L\rangle\) and \(\langle T E X M F-H O M E\rangle\). Since kpsewhich is a command-line application, you will need a command prompt or terminal open (see Section 2.5). At the command prompt, type
kpsewhich -var-value=TEXMFHOME
to display the location of \(\langle T E X M F-H O M E\rangle\) or
kpsewhich -var-value=TEXMFLOCAL
to display the location of \(\langle T E X M F-L O C A L\rangle\). (Remember to press the enter \(\longleftarrow\) key at the end of the line.)

\section*{A Downloading and Installing Packages}

The documentation for \(\mathrm{AT}_{\mathrm{E}} \mathrm{X}\) classes and packages can be found in the doc/latex sub-directories: \(\langle T E X M F\rangle /\) doc/latex, \(\langle T E X M F-L O C A L\rangle / d o c /\) latex and \(\langle T E X M F-H O M E\rangle /\) doc/latex.

Figure A. 1 The TEX Directory Structure (TDS) Showing the Main ETEXRelated Sub-Directories.

Some packages are supplied in this format. \({ }^{\text {A. } 1}\) For example, the package sample-package may be distributed in a compressed file sample-package.tds.zip, which contains the files

\footnotetext{
\({ }^{\text {A.1 }}\) Complete list at http://mirror.ctan.org/install/macros/latex/contrib/.
}

\section*{A Downloading and Installing Packages}
doc/latex/sample-package/sample-package.pdf
tex/latex/sample-package/sample-package.sty
tex/latex/sample-package/sample-foo.sty
tex/latex/sample-package/sample-bar.sty
In this case all you need to do is decompress the contents of the archive into the \(\langle T E X M F-L O C A L\rangle\) or \(\langle T E X M F-H O M E\rangle\) directory.

On older \(\mathrm{T}_{\mathrm{E}} \mathrm{X}\)-distributions, you would then need to refresh the \(\mathrm{T}_{\mathrm{E}} \mathrm{X}\) database (described in Section A.2). With new distributions, you don't need to do this if you are installing a new package into your \(\langle T E X M F-H O M E\rangle\) directory.

\section*{Example (Unix-Like):}

To install sample-package.tds.zip (assuming you're in the same directory as that file):
unzip -d ~/texmf sample-package.tds.zip

\section*{A. 1 DTX and INS Files}

Not all packages are provided in the TDS [14] format. Instead (or additionally) many are supplied with the code and documentation all bundled

\section*{A Downloading and Installing Packages}
together in one file. This file usually has the extension .dtx, and it usually comes with an installation script that has the extension .ins. Once you have downloaded the . dtx and .ins files, you will then have to extract the code before you can use it. Let's go back to the previous example. The package sample-package is now distributed in a DTX file, so the sample-package.zip archive contains the files
sample-package.dtx sample-package.ins
(with hopefully a README or INSTALL file). Note that this archive, unlike the TDS one, doesn't contain any . sty files. The documentation source and the package code (sample-package.sty, sample-foo.sty and sample-bar.sty) are all contained in the file sample-package.dtx. This is how to extract them:
1. Extract the contents of sample-package.zip to a temporary directory.
2. Run \(\mathrm{ET}_{\mathrm{E}} \mathrm{X}\) on the file sample-package.ins. If you are using a terminal, you can type the following at the command prompt:
latex sample-package.ins

If you are using a front-end, such as TeXWorks, open the .ins file (for example sample-package.ins), and click on the build/typeset button.

This will create the files containing the package code. In this example it will create the main package file sample-package.sty and supplementary packages sample-foo.sty and sample-bar.sty.
3. Make a sub-directory of \(\langle T E X M F-L O C A L\rangle /\) tex/latex \({ }^{\text {A. } 2}\) in which to place these files. In this example, the package is called "samplepackage", so make a sub-directory called sample-package.
4. Move the files created in Step 2 into the new sub-directory you created in the previous step.
5. Run PDFETEX on the file sample-package.dtx. (The same as in Step 2, but use the file sample-package.dtx instead of sample-package.ins.) This will create a file called sample-package.pdf. You may need to repeat this step to ensure that the cross references are up-to-date. Check the README file or INSTALL file to see if there is anything else you need to do. (If you have downloaded the package from CTAN, it's possible that the documentation has already been supplied, as

\footnotetext{
A. 2 or \(\langle T E X M F-L O C A L\rangle \backslash\) tex \(\backslash\) latex on Windows
}
package authors are encouraged to supply a PDF version of the documentation for on-line viewing. If so, you can omit this step.)
6. Make a sub-directory of \(\langle T E X M F-L O C A L\rangle /\) doc/latex \({ }^{\text {A. } 3}\) in which to place the documentation. In this example, the package is called "sample-package", so make a sub-directory called sample-package.
7. Move the files created in Step 5 into the new sub-directory you created in the previous step.

As mentioned above, on older \(\mathrm{T}_{\mathrm{EX}}\)-distributions, you would then need to refresh the \(\mathrm{T}_{\mathrm{E}} \mathrm{X}\) database, but this isn't required for \(\langle T E X M F-H O M E\rangle\) installs on new distributions.

\section*{A. 2 Refreshing the \(T_{E} X\) Database}

On older \(\mathrm{T}_{E} \mathrm{X}\) distributions you had to refresh the \(\mathrm{T}_{\mathrm{E}} \mathrm{X}\) database whenever you installed new classes or packages. With newer installations you don't need to do this if you install them in your \(\langle T E X M F-H O M E\rangle\) directory, except under certain circumstances (for example, you're using using a networked drive). If it turns out that \(\mathrm{T}_{\mathrm{E}} \mathrm{C}\) can't find a new class or package

\footnotetext{
A. 3 or \(\langle T E X M F-L O C A L\rangle \backslash\) doc \(\backslash\) latex on Windows
}

\section*{A Downloading and Installing Packages}
you have installed in \(\langle T E X M F-H O M E\rangle\) you will need to update the database using the texhash (or mktexlsr) application. This is a command-line application, so you need a terminal or command prompt (see Section 2.5).

For example, on UNIX/Linux, to update \(\langle T E X M F-H O M E\rangle\) (the directory \(\sim /\) texmf) you need to type the following at the command prompt:
texhash ~/texmf
If you are using a modern \(\mathrm{T}_{\mathrm{E}} \mathrm{X}\) distribution, such as MiKTeX, TeX Live or MacTeX there should be a package manager that has a package installation and refresh facility. For example, TeX Live comes with the TeX Live Manager (tlmgr or mactlmgr) and recent versions of MiKTeX have an application called MiKTeX Update Wizard which can automatically download and install known packages.

If you experience any problems, contact your system administrator for help or try one of the resources listed in Appendix C (Need More Help?).

\section*{B. Common Errors}
- If you're running \({ }^{E T} T_{E} X\) from a terminal and the only message that gets displayed is:
latex: Command not found.
or
Bad command or file name
then you have either mistyped the command name, or you don't have EATEX installed on your computer, or your path hasn't been set up correctly. First check that you have typed the command correctly, then check to see if you have \(\mathrm{T}_{\mathrm{E}} \mathrm{X}\) installed. Failing that, contact your system administrator for help or try one of the resources listed in Appendix C (Need More Help?).
- If you're running ETEX from a terminal and you get the message (or something similar):

This is TeX, Version 3.14159 (Web2C 7.3.1)
! I can't find file 'sample'.
<*> sample
Please type another input file name:
then you have either misspelt the filename or you are in the wrong directory. If you have misspelt the filename, simply type in the correct name at the prompt. If you are in the wrong directory or you want to quit, type \(X\) followed by the return character \(\longleftarrow\). To check you are in the right directory, on a Unix-like system you can type:
ls
This will list the contents of the directory. If you are certain that you have spelt the filename correctly and that you are in the right directory, there may be something wrong with your path, in which case contact your system administrator.
- Error messages will usually look something like:
! Undefined control sequence.

1.1 \docmentclass
[12pt]{scrartcl}
?

The first line is the error message. In this example I have misspelt the command \documentclass. The next line begins with 1. followed by a number. This is the line number in the source code where the error occurred. In this case the error occurred on line 1. Following the line number is the input line \(\mathrm{ET} E \mathrm{X}\) has processed so far, and staggered on the next line is the remainder of the input line.

Here's another example. Suppose line 8 of my source code looks like:

The date today is: \toady, which is nice to know.
The error in this case is the misspelling of the command \today. The error message will appear as follows:

B Common Errors

At the IATEX prompt, you can either type h for a help message, or type x to exit ETEX and go back to your source code and fix the problem.

There follows below a list of common error messages. If your problem isn't listed there, try the UK FAQ [18].

\section*{B. 1 * (No message, just an asterisk prompt!)}

You've gone into \(\mathrm{T}_{\mathrm{E}} \mathrm{X}\) ! This is probably because you've forgotten the \end } \{document \}. The asterisk is the \(\mathrm{T}_{\mathrm{E}} \mathrm{X}\) prompt. At this point the best thing to do is to abort the \(\mathrm{T}_{\mathrm{E}} \mathrm{X}\) run.

B Common Errors

\section*{B. 2 Argument of \cline has an extra \}}

If this error occurred on the first line in your tabular environment, you may have forgotten the argument to the tabular environment.

\section*{B. 3 Argument of \(\backslash\) multicolumn has an extra \}}

If this error occurred on the first line in your tabular environment, you may have forgotten the argument to the tabular environment.

\section*{B. \(4 \backslash\) begin \(\{\ldots\}\) ended by \(\backslash\) end \(\{\ldots\}\)}

The beginning of your environment doesn't have a matching end.
- Check to make sure you have spelt the name of the environment correctly.

You will get this error message if you do, say,
\end\{docment\} }
instead of
\end\{document \} }
- Check that for every \begin you have a corresponding \end with the same name.

\section*{B. 5 Bad math environment delimiter}

Only a certain type of character may be used as a delimiter (for example, ( ) [ ]), check which one you have specified. This error may also occur if you have forgotten a \right or not used it in the same scope. (Remember to use a . if you want an invisible delimiter) or you may have forgotten to end your array environment with \end\{array\}. }

\section*{B. 6 Can only be used in preamble.}

Some commands, such as \usepackage may only appear in the preamble. Check to see where you have put it. For example, this error will be caused by doing:
\documentclass\{scrartcl\}

B Common Errors
\begin\{document\} }
\usepackage\{graphicx\}
instead of
\documentclass\{scrartcl\}
\usepackage\{graphicx\}
\begin\{document\} }

\section*{B. 7 Command ... already defined}

You have tried to define a command which already exists. Try giving it a different name. Remember never to redefine a command if you don't know what the command originally does.

Alternatively, you have tried to define an environment which already exists. Give the new environment a different name. Again, never redefine an environment where you don't know what the original environment does.

\section*{B. 8 Display math should end with \$\$}

You may have a dollar sign (\$) in a displayed maths environment, such as the equation environment. Remember that \(\$\) is short hand for \(\backslash\) begin \{math\} or \end\{math\}, so you can't end one of the other environments with a \$. } (This error message is in fact a bit confusing, as it seems to be suggesting that you end a displayed maths environment with \(\$ \$\) which you also shouldn't do.)

\section*{B. 9 Environment ... undefined}

LATEX doesn't recognise the environment you have specified.
- Check you have spelt the environment name correctly. You will get this error if you do, say,
\(\backslash\) begin\{docment \(\}\) instead of
\begin\{document\} }
[FAQ: Why use
\(\backslash[\ldots \backslash]\) in place of \$\$...\$\$]
- If it's your own environment, check you have defined the environment before using it.
- If the environment is defined in a package, check you have included the package using the \usepackage command.

\section*{B. 10 Extra alignment tab has been changed to \(\backslash \mathrm{cr}\)}

You have too many ampersands (\&) in one row. The most probable cause is that you have forgotten the end of row command \(\backslash \backslash\) on the previous row. Remember also that if you have a \(\backslash\) multicolumn command to span more than one column, you should have fewer \&s in that row. This error can also occur from a confusion over the two meanings of \(\backslash \backslash\) : a line break within a paragraph cell and a row break. In which case, you need to use \tabularnewline instead of \(\backslash \backslash\).

\section*{B. 11 Extra \(\backslash\) right}

There are a number of possible causes. The most probable is that you have a \(\backslash\) right that doesn't have a matching \(\backslash\) left. (Remember left comes before right.) Another possible cause is that you have missed out \end\{array\}. }

B Common Errors
(Remember that environments provide implicit grouping, and \left and its matching \right must appear within the same group level.)

\section*{B. 12 File ended while scanning use of ...}

The most usual cause of this error is a missing closing brace.
You will get this error if you do, say,
\end\{document }
instead of
\end\{document\} }

\section*{B. 13 File not found}
\({ }^{L T} T_{E} X\) can't find the file you have specified. You will be given the opportunity to type in the correct filename at the prompt. If you want to quit, simply type \(X\) followed by the return character \(\longleftarrow\).
- Make sure that you have spelt the filename correctly.

This error will be caused by, say,

\documentclass\{scrarticle\}

instead of
\documentclass\{scrartcl\}
If this is the case, simply type in the correct name at the prompt (followed by the return character \(\longleftarrow\) ) then go back and fix the spelling in the source code.
- Make sure that the file is in the same directory as your document or in the ETEX path. If the file is in another directory (not in the IATEX path), you will need to specify the pathname, but remember that when using ETEX under Windows, you need to use a forward slash (/) as the directory divider, as a backslash would be interpreted as a command. For example, if you have a file called shapes.pdf in the subdirectory pictures then you would get a "file not found" error message if you did
\includegraphics\{shapes\}
instead of
\includegraphics\{pictures/shapes\}
- If the file is a package or class file, it's possible that you don't have that file installed on your computer. If this is the case you will need to download and install it as described in Appendix A (Downloading and Installing Packages). Remember that you need to refresh the database after installing a new package or class file.

\section*{B. 14 Illegal character in array arg}

You have used a character in the argument of a tabular or array environment that is not allowed. The standard available characters are: r (right justified), 1 (left justified), c (centred) and p, as well as @\{〈inter-col text \(t\rangle\}\). Remember that if you want to use the \(>\{\langle d e c l\rangle\}\) or \(\langle\{\langle\operatorname{dec} l\rangle\}\) specifiers, you must include the array package.

This error will also occur if you have forgotten the argument to the tabular or array environment.

\section*{B. 15 Illegal parameter number in definition}

You have referred to a parameter (argument) number that is greater than the number of parameters you have specified. For example, suppose you defined the command to have only one parameter, then you can't use \#2 which refers to the second, non-existent, parameter. Remember that you need to specify how many parameters you want in the optional argument to \newcommand, otherwise it will be assumed that the command has no arguments.

\section*{B. 16 Illegal unit of measure (pt inserted)}

You have either not specified a unit when giving a length (even zero lengths must have a unit) or you have specified an invalid unit or you have misspelt the unit. Available units are listed in Table 2.1.

\section*{B. 17 Lonely \(\backslash\) item}

The command \(\backslash i t e m\) may only appear in one of the list making environments (such as itemize). Make sure you haven't forgotten your environment.

B Common Errors

\section*{B. 18 Misplaced alignment tab character \&}

You have used the special character \& where you shouldn't have. Recall from Section 4.3 that if you want an \& sign to appear you need to do \\& not just \&

You would have got this error message if you had done, say,
\& our equipment
instead of
\\& our equipment

\section*{B. 19 Missing \} inserted}

You have missed a closing curly brace, or you may have missed out an argument.

\section*{Example:}

If the following line occurs in a tabular environment:
\& \multicolumn\{2\}\{c\}\\\}
this will produce the error. (The third argument to \multicolumn has been omitted.)

B Common Errors

\section*{B. 20 Missing \$ inserted}

This message can be caused by a number of errors:
- You might have missed the beginning of one of the mathematics environments (that is, you've used a command that must only appear in maths mode).
- You may have typed \$ instead of \\$ (you actually want a dollar symbol to appear). Recall from Section 4.3 that if you want a \(\$\) sign to appear you need to do \(\backslash \$\) not just \(\$\).
You would have got this error message if you had done, say,
expenditure came to \(\$ 2000.00\)
instead of
expenditure came to \(\backslash \$ 2000.00\)
- You may have missed the end of a mathematics environment, or you may have a paragraph break within an in-line or displayed maths environment, where it is not permitted. Make sure you don't have any blank lines within the environment. If you want a blank

B Common Errors
line in your code to make it easier to edit, try having a percent sign at the start of an empty line to ensure that the line is ignored by LETEX. For example:
\begin\{equation\} }
\%
\(\mathrm{E}=\mathrm{mc}^{\wedge} 2\)
\%
\end\{equation\} }

\section*{B. 21 Missing \begin\{document\} }}

You have put some text outside of the document environment. Check the following:
- You have remembered \begin\{document\} }

This error would be caused by, say,
\documentclass\{scrartcl\}
This is a simple document

\section*{B Common Errors}

instead of
\documentclass{scrartcl}
\begin{document}
This is a simple document.

- You haven't placed any text before \(\backslash\) begin\{document \(\}\). For example:
\documentclass\{scrartcl\}
This is a simple document
\begin\{document\} }
instead of
\documentclass\{scrartcl\}
\begin\{document\} }
This is a simple document
- You haven't missed out the backslash at the start of either \documentclass or \begin\{document\} }
This error would be caused by, say,

Previous Next First Last Back Forward Summary Index

B Common Errors

documentclass{scrartcl}

instead of

\documentclass{scrartcl}

 B. 22 Missing delimiter

You have forgotten to specify the type of delimiter you want (for example, ( ) [ ] <br>{ <br>}). (Remember to use a . if you want an invisible delimiter, and remember that if you want a curly brace, you must have a backslash followed by the curly brace.)

 Example:

This error will occur if you do, say,

f(x) = \left{
\begin{array}{ll}
0 & x \leq 0\\
1 & x > 1
\end{array}
\right.

B Common Errors
instead of
$f(x)=\backslash l e f t \backslash\{$
\begin\{array\}\{ll\} }
0 \& $x \backslash l e q 0 \backslash \backslash$
$1 \& x>1$
\end\{array\} }
$\backslash$ right.

 B. 23 Missing \endcsname inserted

This is a $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ error rather than a $\mathrm{ET}_{\mathrm{EX}}$ error which makes it harder to determine the cause, however it can be caused by placing a backslash in front of the name of an environment. (Remember that environment names do not contain a backslash.)

This error will be caused by, say,
\begin\{\sffamily\} }
instead of
\begin\{sffamily\} }

 B Common Errors

 B. 24 Missing \endgroup inserted

A number of things could have caused this. You may have missed out the end of an environment, or you may have an environment inside of another environment it's not allowed to be in. For example, this error can be caused by placing an eqnarray environment inside a displaymath environment, which is not allowed. (But, of course, you haven't used either of those obsolete environments [15], have you?)

 B. 25 Missing number, treated as zero

LATEX is expecting a number. If your command takes more than one argument, check to make sure the arguments are in the correct order. For example, if you are using a minipage environment, you might have omitted the mandatory argument which specifies the width of the minipage, or you may have the optional arguments the wrong way round. The placement specifier should come first, followed by the height.

If you are using \addtocounter or \setcounter remember that the second argument must be a number, so if you want the value of a counter as the argument you must use \value. This error can be caused by, say,
\setcounter\{exercise\} \{chapter\}

B Common Errors
instead of
\setcounter\{exercise\}\{\value\{chapter\}\}

 B. 26 Paragraph ended before $\backslash$ begin was complete

You've probably missed a closing brace at the end of the argument to $\backslash$ begin. This error will be caused by, say,
$\backslash$ begin\{document
instead of
\begin\{document\} }

 B. 27 Runaway argument

There are a number of possible causes of this error:
2 Paragraph breaks are not permitted in the arguments of short commands. If there is a corresponding environment then you should use that instead. For example, this error message will be generated by doing, say,

B Common Errors

\textbf{This is a simple document.
Here is the first paragraph.
Here is the second paragraph.}
instead of
\begin{bfseries}
This is a simple document.
Here is the first paragraph.
Here is the second paragraph.
\end{bfseries}

3 The closing brace of a mandatory argument is missing: This error will be caused by, say,

\title\{A Simple Document

instead of

\title\{A Simple Document\}

Previous Next First Last Back Forward Summary Index

B Common Errors
4 This error can also be caused by omitting the mandatory argument of an environment. For example, this error will occur if you do, say,
\begin\{thebibliography\} }
\bibitem\{kopka95\} A Guide to \LaTeXe
instead of
\begin\{thebibliography\}\{1\} }
\bibitem\{kopka95\} A Guide to \LaTeXe

\section*{B. 28 Something's wrong-perhaps a missing

- }

You may have missed an

- command. The first object in a list environment must either be an
- command, or another list environment. This error will be caused by, say,
\(\backslash\) begin\{itemize\}
Animal

- Vegetable

- Mineral
\end\{itemize\} }

B Common Errors
instead of
\begin\{itemize\} }

- Animal

- Vegetable

- Mineral
\end\{itemize\} }
This error can also be caused by a missing \bibitem in the bibliography.
For example, the error will occur if you do, say,
\(\backslash\) begin\{thebibliography\}\{1\}
A Guide to \LaTeXe
instead of
\begin\{thebibliography\}\{1\} }
\bibitem\{kopka95\} A Guide to \LaTeXe
See also UK FAQ [18] entry: Perhaps a missing \(\backslash i t e m\) ?.

 B. 29 There's no line here to end

You have placed a line breaking command (such as <br>, \newline or $\backslash$ linebreak) where it doesn't make sense to have one.

B Common Errors

 B. 30 Undefined control sequence

${ }^{\text {LAT }}$ EX doesn't understand the command you have used.
5 Check to see if you have misspelt the command name (remember that all ${ }^{E T} T_{\mathrm{EX}}$ command names are case-sensitive.)
You will get this error if you do, say,
This is a simple \Latex $\backslash$ document
instead of
This is a simple $\backslash$ LaTe $X \backslash_{\sqcup}$ document
6 Check that you have remembered the space when typing $\_{\triangleleft}$ (backslash space). For example, this error will occur if you do, say,

This is a $\backslash$ LaTeX $\backslash$ sample document.
instead of
This is a \LaTeX $\backslash\lrcorner$ sample document
7 If you are using a command that is defined in a package make sure you have included the package using undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined
8 Check that your command name hasn't run into the next piece of text. For example, you can do

man\oe{}uvre

or
man\oe uvre
or (not recommended)
$\operatorname{man}\{\backslash o e\} u v r e$
but not
man\oeuvre
9 Check if you have used a backslash instead of a forward slash as a directory divider. (Remember that when using $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ under

Windows, you need to use a forward slash (/) as the directory divider, as a backslash would be interpreted as a command.)
For example, suppose you have a file called shapes.pdf in a subdirectory called pictures, then you would get an error if you did

instead of

 B. 31 You can't use 'macro parameter character \#' in horizontal mode

You have used the special character \# where you shouldn't have. Recall from Section 4.3 that if you want a \# sign to appear you need to do $\backslash \#$ not just \#.

This error message will be caused by doing, say,
Item \#1
instead of
Item <br>\#1

 C. Need More Help?

First, try to find your query in the UK FAQ [18]. TUG [16] also has a list of useful resources at http://tug.org/interest.html. If you're still stuck, you can post your question on a (La)TeX forum, newsgroup or mailing list, such as those listed below. If you do post a question, remember you're asking people who only have an altruistic interest in helping. No one is paying them to help you. Most of the class files and packages were written for free by people who had a need to solve a particular problem and decided to make their work publicly available. So no matter how frustrated you're feeling, stick to being polite. If you can't work out how to use a particular class or package, don't start by heaping offensive, unconstructive criticism on it as there's a chance the author will read the message. There's no sense in alienating the person most qualified to answer your question. In your message, stick to the following guidelines:

10 Cut to the chase. In other words, be concise about the nature of the problem. Don't write lots of long-winded paragraphs.
C Need More Help?
2. Provide a minimal example ${ }^{\mathrm{C} .1}$ that illustrates the problem.

 Example:

I'm trying to use the \foo command in the "bar" package, but I'm getting the following error message:
! Undefined control sequence.
1.4 \foo
Here's a minimal example:
\documentclass\{scrartcl\}
\usepackage\{bar\}
\begin\{document\} }
\(\backslash\) foo Blah\}
\end\{document\} }
I'm using bar version 1.0 (2012/06/30).

 Another example:

I'm using the \foo command in the "bar" package. According to the documentation, this command should display its argument
C. 1 see http://www.dickimaw-books.com/latex/minexample/

C Need More Help?
in a bold font, but it's coming out in italic instead.
Anyone know why?
Here's a minimal example:
cl\}\usepackage\{bar\}\begin\{document\}}$\backslash$fooBlah\}\end\{document\}}I'musingbarversion1.1(2012/07/30).There'snoguaranteethatyouwillgetananswer,butifyoufollowtheaboveguidelines,youwillincreaseyourchances.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

 Resources

1 The ETEX $_{\text {E }}$ Community (http://www.latex-community.org/).
2 $\mathrm{T}_{\mathrm{E}} \mathrm{X} / \mathrm{ET}_{\mathrm{E}} \mathrm{X}$ on StackExchange (http://tex.stackexchange.com/).
3 comp. text. tex newsgroup (use a newsreader rather than the Google interface if you want to avoid the spam).
4 texhax archives.

I strongly recommend that you also have a look at the On-Line Catalogue [21]. It's also a good idea to look at the documentation that was installed with your $\mathrm{T}_{\mathrm{E}} \mathrm{X} / \mathrm{ET}_{\mathrm{E}} \mathrm{X}$ distribution (see Section 1.1). If you are using MiKTeX you can access the on-line help via the Start Menu:

$$
\text { Start } \rightarrow \text { Programs } \rightarrow \text { MiKTeX } \rightarrow \text { Help }
$$

(Please don't send your problems to me, unless you want to hire a consultant. I read both the EATEX Community Forum and comp.text.tex and answer relevant questions if I have time, but it clogs up my inbox if people keep sending attachments that are in the order of several megabytes in size.) Besides, you'll reach a wide group of experts if you post to a newsgroup, forum or mailing list, rather than a single busy individual.

 Summary

Commands or environments defined in the $E T_{E} X$ kernel are always avail－ able．

Symbols
！
1）Used in \resizebox to maintain aspect ratio［§6．1］；2）Exclamation symbol（end of sentence marker） ［§2．13］．
！‘
Defined in：ETEX Kernel．
Upside－down exclamation mark i symbol．See also
¡．［§4．3］

A visual indication of a space in the code．When you type up the code，replace all instances of this symbol with a space via the space bar on your keyboard．［§2．0］
\＃〈digit〉
Defined in： AT $_{E} X$ Kernel．
Replacement text for argument〈digit $\rangle$ ．［§8．0］
\＄
Defined in：ETEX Kernel．

Switches in and out of in-line math mode. [§9.1]
\%
Defined in: ATEX Kernel. $^{2}$
Comment character used to ignore everything up to and including the newline character in the source code. [§2.0]

 \&

Defined in: ATTEX Kernel. $^{2}$
Alignment tab. [84.6]
,
Defined in: ${ }^{\text {ATEX }}$ Kernel.
Closing quote or apostrophe' symbol in text mode or prime symbol ' in math mode. See also ’. [§4.3]
, ,
Defined in: ETEX Kernel.
Closing double quote " symbol in text mode or double prime " in math mode. See also ”. [84.3]
(
Defined in: ETEX Kernel.
Opening parenthesis in text mode or left round bracket delimiter in math mode. [§9.4]

 )

Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel.
Closing parenthesis in text mode or right round bracket delimiter in math mode. [§9.4]

Defined in: ETEX Kernel.

Hyphen - in text mode or minus sign - in math mode. [§4.3]

Defined in: ETEX Kernel.
En-dash - symbol. (Normally used for number ranges.) See also
–. [§4.3]

Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Em-dash - symbol. (Normally used to indicate omissions or interruptions or to highlight a parenthetical element.) See also —. [§4.3]

Defined in: ATEX Kernel. $^{2}$

5 invisible delimiter [§9.4]; 2) period (full stop) or decimal point [§2.13].
/
6 Forward slash delimiter (math mode) [§9.4]; 2) Directory divider [§6.0]; 3) Forward slash symbol (see also \slash) [§2.0].
<
Defined in: ETTEX Kernel (Math Mode).
Less than symbol. (Use < in text mode.) [84.3]
$<\{\langle\operatorname{dec} l\rangle\}$
Defined in: array package.
Used in tabular or array column specifiers after l, r, c, p, m or b to insert $\langle d e c l\rangle$ directly after the entry for that column. [84.6]
>
Defined in: EATEX Kernel (Math Mode).
| Symbols |  |  |
| :---: | :---: | :---: |
| A | N |  |
| B | O |  |
| C | P |  |
| D | Q |  |
| E | R |  |
| F | S |  |
| G | T |  |
| H | U |  |
| I | V |  |
| J | W |  |
| K | X |  |
| L | Y |  |
| M | Z |  |

Greater than symbol. (Use > in text mode.) [§4.3]
$>\{\langle\operatorname{dec} l\rangle\}$
Defined in: array package.
Used in tabular or array column specifiers before l, r, c, p, m or b to insert $\langle$ decl $\rangle$ directly in front of the entry for that column. [§4.6]

 ?

Question mark (end of sentence marker). [§2.13]
?‘
Defined in: ETEX Kernel. $^{\text {E }}$
Upside-down question mark ; symbol. See also
¿. [§4.3]
@ $\{\langle$ text $\rangle\}$
Defined in: ATEX Kernel. $^{2}$

Used in the argument of tabular or array like environments to specify text to insert between columns. [§4.6]

 [

Defined in: ${ }^{\text {ATEX }}$ Kernel.

1 Left square bracket delimiter in math mode [§9.4]; 2) Open delimiter of an optional argument [§2.8]; 3) Open square bracket in text mode [§4.4].
<br>\&
| Symbols |  |  |
| :---: | :---: | :---: |
| A | N |  |
| B | O |  |
| C | P |  |
| D | Q |  |
| E | R |  |
| F | S |  |
| G | T |  |
| H | U |  |
| I | V |  |
| J | W |  |
| K | X |  |
| L | Y |  |
| M | Z |  |

Defined in: ${ }^{A T} T_{E X}$ Kernel.
Ampersand \& symbol [\&4.3]

Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Escape character (indicates a command). [§2.6]
<br>\$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Dollar \$ symbol. [84.3]
<br>\#
Defined in: ATEX Kernel. $^{\text {E }}$
Hash \# symbol. [§4.3]

 <br>%

Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel.
Percent \% symbol [§4.3]
\!
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Negative thin space. [§9.4]
$\backslash "\{\langle c\rangle\}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Umlaut over $\langle c\rangle$. Example: $\backslash "\{0\}$ produces ö. [§4.3]
\’ $\{\langle c\rangle\}$
Defined in: ETEX Kernel.
Acute accent over $\langle\mathrm{c}\rangle$. Example:
\’\{o\} produces ó. [84.3]
<br>(
Defined in: ${ }^{A T} T_{E} X$ Kernel.
Equivalent to \begin\{math\}. [§9.1] }
<br>)
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Equivalent to \end\{math\}. [§9.1] }
<br>,
Defined in: ${ }^{\text {ET }} \mathrm{EX}$ Kernel.
Thin space. [§9.4]
\-
Defined in: ATEX Kernel. $^{2}$
Insert discretionary hyphen.
[§2.14]

Symbols
A $\quad \mathrm{N}$
B O
C $\quad \mathrm{P}$
D $\quad$ Q
E R
F S
G $\quad$ T
H U
I V
J W
K X
L Y
M
Z
$\backslash .\{\langle c\rangle\}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Dot over $\langle c\rangle$. Example: $\backslash .\{o\}$ produces ò. [§4.3]

Defined in: ATE $_{E} X$ Kernel.
Italic correction. [§4.5]
\:
Defined in: ETEX $_{E}$ Kernel (Math Mode).
Medium space. [§9.4]
\;
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Thick space. [§9.4]
$\backslash=\{\langle c\rangle\}$
Defined in: $\mathrm{ATEX}^{\mathrm{E}}$ Kernel.

Macron accent over $\langle c\rangle$. Example: $\backslash=\{0\}$ produces ō. [§4.3]
\@
Defined in: ATEX Kernel $^{2}$
Used when a sentence ends with a capital letter. This command should be placed after the letter and before the punctuation mark. [§2.13]

\[
Defined in: ATEX Kernel (inconsistency corrected in amsmath).
Starts an unnumbered single-line of displayed maths. [§9.2]
<br>[〈height $\rangle]$
Defined in: $\mathrm{IAT}_{\mathrm{E}} \mathrm{X}$ Kernel.

1 Breaks a line without
justification (starred form forbids
a page break) [§2.8]; 2) Starts a new row in tabular-style environments [§4.6].
$\_{\bullet}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
(Backslash followed by space character.) Horizontal spacing command. [§2.13]

 \]

Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel (inconsistency corrected in amsmath).
Ends an unnumbered single-line of displayed maths. [§9.2]
\^\{〈c $\rangle\}$
Defined in: ${ }^{\text {ETTXX Kernel. }}$
Circumflex accent over $\langle c\rangle$. Example: $\backslash \wedge\{0\}$ produces $\hat{o}$. [§4.3]
\_
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Underscore _ symbol (see also -). [§4.3]
\‘\{ $\{c\rangle\}$
Defined in: ${ }^{A T} T_{E} X$ Kernel.
Grave accent over $\langle c\rangle$. Example:
\‘\{o\} produces ò. [§4.3]
<br>{ }
Defined in: ${ }^{A T} T_{E} \mathrm{X}$ Kernel.
Left brace \{ character. In math mode may be used as a delimiter. [84.3]
\।
Defined in: ${ }^{\mathrm{AT}} \mathrm{T}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Double vertical bar \| delimiter [§9.4]

 <br>\(

\)}Defined in: ETEX Kernel.
Right brace \{ character. In math mode may be used as a delimiter. [§4.3]
$\backslash \sim\{\langle c\rangle\}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Tilde accent over $\langle c\rangle$. Example:
<br>~\{o\} produces õ. [§4.3]
]
Defined in: ATEX Kernel. $^{\text {I }}$

1 Right square bracket delimiter in math mode [§9.4]; 2) Closing delimiter of an optional argument
[§2.8]; 3) Closing square bracket in text mode [§4.4].
${ }^{\wedge}\{\langle$ maths $\rangle\}$
Defined in: ${ }^{A T} T_{E X}$ Kernel (Math Mode).
Displays its argument as a superscript. [§9.4]
_\{〈maths $\rangle\}$
Defined in: ETEX Kernel (Math Mode).
Displays its argument as a subscript. [§9.4]

،
Defined in: ${ }^{\text {ATTXX Kernel. }}$
Open quote ' symbol. See also ‘. [84.3]

Symbols
A $\quad \mathrm{N}$
B O
C $\quad \mathbf{P}$
D $\quad$ Q
E R
F S
G T
H U
I V
J W
K X
L
M

،
Defined in: ${ }^{\text {ETEX K }}$ Kernel.
Open double quote " symbol. See also “. [§4.3]
\{
Defined in: ${ }^{\text {ATEX K }}$ Kernel.

Marks the beginning of a group. [§2.7]

 |

Defined in: ATEX Kernel. $^{2}$

1 Vertical rule specifier (tabular or array) [§9.4]; 2) Delimiter. (Math mode only. Use | in text mode.) [§9.4].
\}
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Marks the end of a group. [§2.7]
Defined in: ATEX Kernel. $^{\text {I }}$
Unbreakable space. [§4.5]
A
$\backslash$ AA
Defined in: ATEX Kernel. $^{\text {P }}$

Upper case A-ring Å character. [84.3]
$\backslash \mathrm{aa}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Lower case a-ring å character. [84.3]
\begin\{abstract\} }
Defined in: Most article- or report-style classes, such as scrartcl or scrreprt. Not usually defined in book-style classes, such as scrbook, but is defined in memoir.

| Symbols |  |
| :---: | :---: |
| A | N |
| B | O |
| C | P |
| D | Q |
| E | R |
| F | S |
| G | T |
| H | U |
| I | V |
| J | W |
| K | X |
| L | Y |
| M | Z |

Displays its contents as an abstract. [§5.2]
\abstractname
Defined in: Classes or packages that define an abstract environment.
Text used in abstract heading.
[§8.2]
\addcontentsline $\{\langle$ toc $\rangle\}\{\langle$ section unit $\rangle\}\{\langle$ text $\rangle\}$
Defined in：${ }^{\text {ATEX }}$ Kernel．
Adds a sectional unit header to the contents list．［§5．4］
\addto $\{\langle$ command $\rangle\}\{\langle$ code $\rangle\}$
Defined in：babel package．
Adds $\langle$ code $\rangle$ to the definition of〈command〉．（See also \appto．） ［§8．2］
\addtocounter $\{\langle$ counter $\rangle\}$ \｛〈increment $\rangle\}$
Defined in： ETEX Kernel．$^{\text {P }}$
Increments the value of a counter by the given amount．［\＄11．0］
\addtokomafont $\{\langle$ element name $\rangle$ \} $\{\langle$ commands $\rangle\}$
Defined in：scrartcl，scrreprt and scrbook classes．

Sets the font characteristics for the given KOMA－Script element．［§5．3］
\addtolength $\{\langle$ register $\rangle$ \}
\｛〈dimension $\rangle\}$
Defined in：ATEX Kernel．
Adds $\langle$ dimension $\rangle$ to the value of the given length register．［§2．17］
$\backslash \mathrm{AE}$
Defined in：${ }^{E T} T_{E} X$ Kernel．
Æ ligature．［§4．3］
$\backslash$ ae
Defined in：${ }^{A T} T_{E} \mathrm{X}$ Kernel．
æ ligature．［84．3］
\begin\｛align\}
Defined in：amsmath package．
Used for numbered aligned equations．［§9．3］
\begin\{align*\} }
Defined in: amsmath package.
Used for unnumbered aligned equations. [§9.3]
$\backslash$ Alph $\{\langle$ counter $\rangle\}$
Defined in: ATEX Kernel. $^{2}$
Displays counter value as an upper case letter. (A, B, C, ..., Z) [§11.0]
$\backslash a l p h\{\langle$ counter $\rangle\}$
Defined in: AT $_{E} X$ Kernel.
Displays counter value as a lower case letter. ( $\mathrm{a}, \mathrm{b}, \mathrm{c}, \ldots, \mathrm{z}$ ) [§11.0]
\alpha
Defined in: LATEX Kernel (Math $^{\text {P }}$ Mode).
Greek lower case alpha $\alpha$. [§9.4]
$\backslash$ amalg
Defined in: ${ }^{\mathrm{AT}} \mathrm{T}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Binary operator $\amalg$ symbol. [§9.4]
\and
Defined in: ATEX Kernel. $^{2}$
Used to separate authors in \author [§5.1]
\appendix
Defined in: Most classes that have the concept of document structure. Indicates (but doesn't print anything) that the document is switching to the appendices. If chapters exist, the chapter numbering is reset and switched to a different format (usually upper case letters) otherwise the section

Symbols
A $\quad \mathrm{N}$
B O
C $\quad \mathrm{P}$
D Q
E R
F S
G T
H U
I V
J W
K X
L
M Z
numbering is reset and switched to a different format．［§5．3］
\appendixname
Defined in：Classes or packages that define chapters．

Number prefix used in appendix headings．［§8．2］
\approx
Defined in：ETEX Kernel（Math Mode）．
Relational $\approx$ symbol．［§9．4］
\appto\｛〈command $\rangle$ \}\{〈code〉\}
Defined in：etoolbox package．
Adds $\langle$ code $\rangle$ to the definition of〈command〉．［§8．2］
\arabic $\{\langle$ counter $\rangle$ \}
Defined in：ETEX Kernel．

Displays counter value as an Arabic number．（1，2，3，．．．）［\＄11．0］
$\backslash$ arccos
Defined in：EATEX Kernel（Math Mode）．

Typesets arccos function name． ［§9．4］
$\backslash$ arcsin
Defined in：EATEX Kernel（Math Mode）．

Typesets arcsin function name． ［§9．4］
$\backslash \arctan$
Defined in： ETEX $^{2}$ Kernel（Math Mode）．

Typesets arctan function name． ［§9．4］
\arg
 Mode）．
Typesets arg function name．［§9．4］
$\backslash$ begin\｛array\}[〈v-pos $\rangle$ ］\｛〈column specifiers）\}
Defined in：ETEX Kernel（Math Mode）．
Environment for lining things up in rows and columns．Use tabular for text mode．［§9．4］
\arraycolsep
Defined in： $\operatorname{AT}_{E} X$ Kernel．
Length register specifying half the gap between columns in an array environment．［§9．4］
\ast
Defined in：ETEX Kernel（Math Mode）．

Binary operator＊symbol．［§9．4］
\asymp
Defined in：ETEX Kernel（Math Mode）．
Relational $\asymp$ symbol．［§9．4］
\author\｛〈name〉\}
Defined in：Most classes that have the concept of a title page．
Specifies the document author（or authors）．This command doesn＇t display any text so may be used in the preamble，but if it＇s not in the preamble it must be placed before $\backslash$ maketitle．［§5．1］

 B

$\backslash \mathrm{b}\{\langle\mathrm{c}\rangle\}$
Defined in： ETEX Kernel．
Bar under $\langle\mathrm{c}\rangle$ ．Example：$\backslash \mathrm{b}\{r\}$ produces r．［§4．3］
s

oTUw

$\backslash$ backmatter
Defined in：Most book－style classes，such as scrbook．

Suppresses chapter and section numbering，but still adds unstarred sectional units to the table of contents．（See also \frontmatter and $\backslash$ mainmatter．）［85．7］
$\backslash$ backslash
Defined in：ETEX Kernel（Math Mode）．

Backslash \symbol，which may be used as a delimiter．（Use \ for text mode．） ［§9．4］
\baselineskip
Defined in：${ }^{A T} T_{E} X$ Kernel．
A length register that stores the current interline spacing．This is
recalculated whenever the font changes．［ $\$ 10.0$ ］
\begin\｛〈env－name〉\} [〈envoption $\rangle]\{\langle$ env－arg－1〉\}... \{〈env-argn）\}
Defined in： $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel．
Starts an environment．（Must have a matching \end．）［§2．15］
$\backslash$ beta
Defined in： ETEX K Kernel $^{(M a t h}$ Mode）．
Greek lower case beta $\beta$ ．［§9．4］
\bfseries
Defined in：${ }^{A T} T_{E} X$ Kernel．
Switches to the bold weight in the current font family．［84．5］
\begin\｛bfseries\}
Defined in：ETEX Kernel．

Typesets the environment contents in a bold font．［§2．15］
\bibitem［〈tag $]$ ］$\{\langle$ key $\rangle\}$
Defined in： $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel．
Indicates the start of a new reference in the bibliography．May only be used inside the contents of thebibliography environment［§5．6］
$\backslash$ bibname
Defined in：Report or book style classes that define a bibliography chapter．
Text used for bibliography chapter heading．（See also \refname．） ［§8．2］
$\backslash$ bigcap
Defined in： $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel（Math Mode）．

Collection intersection $\bigcap$ symbol （may take limits）．［§9．4］
$\backslash$ bigcirc
Defined in： $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel（Math Mode）．
Binary operator $\bigcirc$ symbol．［§9．4］
$\backslash$ bigcup
Defined in：ETTEX Kernel（Math Mode）．
Collection union $\bigcup$ symbol（may take limits）．［§9．4］
$\backslash$ Biggl $\langle$ delimiter $\rangle$
Defined in：amsmath package （Math Mode）．
Left delimiter sizing．［§9．4］
\biggl〈delimiter〉
Defined in：amsmath package （Math Mode）．

QT

Left delimiter sizing．［§9．4］
$\backslash \operatorname{Biggr}\langle$ delimiter〉
Defined in：amsmath package （Math Mode）．
Right delimiter sizing．［§9．4］
\biggr〈delimiter〉
Defined in：amsmath package （Math Mode）．
Right delimiter sizing．［§9．4］
$\backslash$ Bigl $\langle$ delimiter $\rangle$
Defined in：amsmath package （Math Mode）．
Left delimiter sizing．［§9．4］
$\backslash$ bigl $\langle$ delimiter $\rangle$
Defined in：amsmath package （Math Mode）．
Left delimiter sizing．［§9．4］

| $\backslash$ bigodot | Symbols |
| :---: | :---: |
| Defined in：EATEX Kernel（Math Mode）． | A N |
|  | B O |
|  | C |
| Big operator $\odot$（may take limits）． ［§9．4］ | D Q |
|  | E R |
|  | F S |
| $\backslash$ bigoplus | G T |
| Defined in：ETEX Kernel（Math | H U |
| Mode）． | V |
| Big operator $\oplus$（may take limits）．[§9.4] | J W |
|  | K X |
|  | L |
| $\backslash$ bigotimes | M Z |
| Defined in：ETEX Kernel（Math Mode）． |  |
| Big operator $\otimes$（may take limits）． ［§9．4］ |  |
| $\backslash \operatorname{Bigr}$（delimiter ${ }^{\text {¢ }}$ |  |
| Defined in：amsmath package （Math Mode）． |  |

Right delimiter sizing. [§9.4]
$\backslash \mathrm{bigr}\langle$ delimiter $\rangle$
Defined in: amsmath package (Math Mode).
Right delimiter sizing. [§9.4]
$\backslash$ bigsqcup
Defined in: ETEX Kernel (Math Mode).
Big operator $\downarrow$ (may take limits). [§9.4]
\bigtriangledown
Defined in: LATEX Kernel $^{(M a t h}$ Mode).
Binary operator $\nabla$ symbol. [§9.4]
$\backslash$ bigtriangleup
Defined in: EATEX Kernel (Math Mode).

Binary operator $\triangle$ symbol. [§9.4]
\biguplus
Defined in: ETEX Kernel (Math Mode).
Big operator $\biguplus$ (may take limits). [§9.4]
$\backslash$ bigvee
Defined in: ATEX Kernel (Math $^{\text {P }}$ Mode).
Big operator $\bigvee$ (may take limits). [§9.4]
$\backslash$ bigwedge
Defined in: ETEX Kernel (Math Mode).
Big operator $\bigwedge$ (may take limits). [§9.4]
\begin\{Bmatrix\} }
Defined in: amsmath package (Math Mode).
Like the array environment, but doesn't have an argument and adds curly brace delimiters. [§9.4]
$\backslash$ begin\{bmatrix\}
Defined in: amsmath package (Math Mode).

Like the array environment, but doesn't have an argument and adds square bracket delimiters. [§9.4]
$\backslash$ bmod
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Modulo operator. [§9.4]
$\backslash$ boldsymbol $\{\langle$ symbol $\rangle\}$
Defined in: amsmath package (Math Mode).
Like \mathbf but also works for numbers and many
nonalphabetical symbols. (See also $\backslash \mathrm{pmb}$.) [§9.4]
\bottomrule[ $\langle w d\rangle]$
Defined in: booktabs package.
Horizontal rule for the bottom of a tabular environment. [\$4.6]
\bowtie
Defined in: ETEX Kernel (Math Mode).
Relational $\bowtie$ symbol. [§9.4]
\bullet
Defined in: ETEX Kernel (Math Mode).

Binary operator • symbol. [§9.4]

 C

$\backslash c\{\langle c\rangle\}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Cedilla under $\langle c\rangle$. Example: $\backslash c\{0\}$ produces o . [84.3]
\cap
Defined in: ${ }^{\text {ETTEX Kernel ( }}$ (Math Mode).
Binary operator $\cap$ symbol. [§9.4]
\caption[〈short caption $\rangle]\{\langle$ caption text $\rangle\}$
Defined in: $\mathrm{ETEX}_{\mathrm{E}}$ Kernel.
Inserts the caption for a float such
as a figure or table. This
command has a moving
argument. [87.0]
\captionsetup[〈float type $\rangle$ ] \{ $\langle$ options $\rangle\}$
Defined in: caption package.
Used to set up the options affecting float captions. [§7.4]
$\backslash$ begin\{cases \}
Defined in: amsmath package (Math Mode).
Like the array environment, but adds a left brace start delimiter and an invisible end delimiter. [§9.4]
\cdot
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Centred dot • symbol. [§9.4]
\cdots
 Mode).

Centred ellipses ．．．symbol．［§9．4］
Defined in：${ }^{\text {ATEX K Kernel．}}$
Switches the paragraph alignment to centred．［§2．12］
\cfrac［〈pos〉］\｛\｛numerator $\rangle\}$ \｛〈denominator〉\}
Defined in：amsmath（Math Mode）．
Displays a continued fraction．
［§9．4］
\chapter［〈short title $\rangle]\{\langle$ title $\rangle\}$
Defined in：Book－style classes （such as scrbook or scrreprt）that have the concept of chapters．
Inserts a chapter heading．This command has a moving argument．［§5．3］
\chaptername
Defined in：Classes or packages that define chapters．

Number prefix used in chapter headings．［88．2］
\chi
Defined in：${ }^{2} T_{E} \mathrm{X}$ Kernel（Math Mode）．

Greek lower case chi $\chi$ ．［§9．4］
\circ
Defined in： $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ Kernel（Math Mode）．
Circle o symbol．［§9．4］
$\backslash$ cite $[\langle$ text $\rangle\rangle]\{\langle$ key list $\rangle\}$
Defined in：${ }^{A_{E}} \mathrm{EX}$ Kernel．
Inserts the citation markers of each reference identified in the
key list. A second run is required to ensure the reference is correct. [§5.6]
\color[〈model $\rangle]\{\langle$ specs $\rangle\}$
Defined in: color and xcolor packages.

A declaration that switches the current foreground colour to the given specification. [§8.0]
\cong
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Relational $\cong$ symbol. [§9.4]
\contentsname
Defined in: Classes or packages that define a table of contents.

Text used for table of contents heading. [§8.2]
\coprod
Defined in: LTT $_{E} X$ Kernel (Math Mode).
Co-product Џ symbol (may take limits). [§9.4]
\copyright
Defined in: ${ }^{A T} \mathrm{E}_{\mathrm{E}} \mathrm{X}$ Kernel.
Copyright © symbol. [§4.3]
\cos
Defined in: LAT $_{E} X$ Kernel (Math Mode).
\cosh
Defined in: LATEX Kernel (Math Mode).
Typesets cosh function name. [§9.4]

\cot
Defined in: ${ }^{A T} T_{E} X$ Kernel (Math Mode).
Typesets cot function name. [§9.4]
\coth
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Typesets coth function name. [§9.4]
\csc
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Typesets csc function name. [§9.4]
\cup
Defined in: ETEX $_{E}$ Kernel (Math Mode).
Operator $\cup$ symbol. [§9.4]
\currenttime
Defined in: datetime package.
Inserts into the output file the time when the EATEX application created it from the source code. [§4.2]

 D

$\backslash d\{\langle c\rangle\}$
Defined in: ETEX Kernel.
Dot under $\langle c\rangle$. Example: $\backslash d\{0\}$ produces o. [§4.3]
$\backslash$ dag

| Symbols |  |  |
| :---: | :---: | :---: |
| A | N |  |
| B | O |  |
| C | P |  |
| D | Q |  |
| E | R |  |
| F | S |  |
| G | T |  |
| H | U |  |
| I | V |  |
| J | W |  |
| K | X |  |
| L | Y |  |
| M | Z |  |

Defined in: ${ }^{A T} T_{E} X$ Kernel.
Dagger $\dagger$ symbol. [§4.3]
\dagger
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Binary operator $\dagger$ symbol. [§9.4]
\dashv
Defined in： $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel（Math Mode）．

Relational † symbol．［§9．4］
$\backslash$ date $\{\langle$ text $\rangle\}$
Defined in：Most classes that have the concept of a title page．
Specifies the document date．This command doesn＇t display any text so may be used in the preamble， but if it＇s not in the preamble it must be placed before \maketitle． If omitted，most classes assume the current date（as provided by \today）．［§5．1］
$\backslash$ ddag
Defined in： ATEX Kernel．$^{2}$
Double－dagger $\ddagger$ symbol．［§4．3］
\ddagger
Defined in：${ }^{\mathrm{AT}} \mathrm{T}_{\mathrm{E}} \mathrm{X}$ Kernel（Math Mode）．
Binary operator $\ddagger$ symbol．［§9．4］
\ddmmyyyydate
Defined in：datetime package．
Changes the format of \today so that it displays the date in the form 07／10／2012（day／month／year in digits）．［§4．2］
\ddots
Defined in：${ }^{2} T_{E} \mathrm{X}$ Kernel（Math Mode）．

Diagonal ellipses ${ }^{\circ}$ ．symbol．［§9．4］
$\backslash$ DeclareCaptionLabelFormat \｛〈name〉\} \{〈code〉\}
Defined in：caption．

Used to defined your own caption label formats．［§7．4］
$\backslash$ DeclareGraphicsExtensions \｛〈ext－list〉\}
Defined in：graphicx package．
Specify the file extensions to look for if no extension is used in
\includegraphics［§6．0］
\DeclareMathOperator\｛〈cmd〉\}
\｛〈operator－name〉\}
Defined in：amsmath package （Preamble Only）．

Defines a new maths operator．
The starred version allows limits． ［§9．4］
$\backslash$ deg
Defined in： $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel（Math Mode）．

Typesets deg function name．［§9．4］
$\backslash$ Delta
Defined in：EATEX Kernel（Math Mode）．

Greek upper case delta $\Delta$ ．［§9．4］
\delta
Defined in：EATEX Kernel（Math Mode）．

Greek lower case delta $\delta$ ．［§9．4］
\begin\｛description\}
Defined in：Most class files．
Labelled list．［§4．4］
$\backslash$ det
Defined in：EATEX Kernel（Math Mode）．

Typesets det function name（may have limits via＿or＾）．［§9．4］

Symbols
A $\quad \mathrm{N}$
B O
C $\quad \mathrm{P}$
D $\quad$ Q
E R
F S
G T
H U
I V
J W
K X
L Y
M Z
$\backslash$ diamond
Defined in： $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel（Math Mode）．
Binary operator $\diamond$ symbol．［§9．4］
$\backslash \operatorname{dim}$
Defined in： EATEX Kernel（Math $^{\text {P }}$ Mode）．
Typesets dim function name．［§9．4］
$\backslash$ ding $\{\langle n\rangle\}$
Defined in：pifont package．
Inserts PostScript ZapfDingbats character with code $\langle n\rangle$ ，which must be an integer．［§8．2］
\begin\｛dinglist $\}\{\langle$ number $\rangle$ \}
Defined in：pifont package．
A list where the item marker is given by character 〈number〉 in the Zapf Dingbats font．［§8．2］
\displaybreak［〈n〉］
Defined in：amsmath package．
Allows a page break in multi－lined maths environments，such as align． ［§9．3］
$\backslash$ div
Defined in：${ }^{\text {ATEX Kernel（Math }}$ Mode）．
Division operator $\div$ symbol．［§9．4］
\begin\｛document\}
Defined in：${ }^{[2 T} T_{E} X$ Kernel．

Symbols
A $\quad \mathrm{N}$
B O
C $\quad \mathrm{P}$
D $\quad$ Q
E R
F S
G T
H U
I V
J W
K X
L
M

The body of the document．［§4．0］
\documentclass［〈option－list $\rangle$ ］
\｛〈class－name〉\}
Defined in： $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel．
Loads the document class file， which sets up the type of document you wish to write．［§4．0］

\downarrow
Defined in: ETEX Kernel (Math Mode).
Down arrow $\downarrow$. (May be used as a delimiter.) [§9.4]

 E

\em
Defined in: ETEX Kernel.
Toggles the upright and
italic/slanted form of the current font family. [\$4.5]
$\backslash$ begin\{em $\}$
Defined in: ATEX Kernel. $^{2}$
Typesets the environment contents in an emphasized font. (Switches to italic/slanted if the surrounding font is upright, or switches to upright if the surrounding font is italic/slanted.) [§4.5]
$\backslash \operatorname{emph}\{\langle$ text $\rangle\}$
Defined in: ETT $_{E} X$ Kernel.
Toggles the upright and italic/slanted rendering of $\langle$ text $\rangle$. [84.5]
\end\{〈env-name〉\} }
Defined in: ${ }^{A T} T_{E} X$ Kernel.
Ends an environment. (Must have a matching \begin.) [§2.15]
\enspace
Defined in: ${ }^{E T} T_{E} X$ Kernel.

Horizontal spacing command (half as wide as \quad). [§2.13]
$\backslash$ begin\{enumerate\}
Defined in: ${ }^{A T} T_{E} X$ Kernel.
Ordered list. [§4.4]
\epsilon
Defined in: EATEX Kernel (Math $^{2}$ Mode).
Greek lower case epsilon $\epsilon$. [§9.4]
\eqref $\{\langle$ label $\rangle\}$
Defined in: amsmath package.
Short cut for ( $\backslash$ reff $\{\langle$ label $\rangle\}$ ) for referencing equations. [§9.2]
\begin\{equation\} }
Defined in: ETEX Kernel. $^{2}$
Displays its contents as a single-lined numbered equation. [§9.2]
\equiv
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).

Relational $\equiv$ symbol. [§9.4]
\eta
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Greek lower case eta $\eta$. [§9.4]
$\backslash \exp$
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Typesets $\exp$ function name. [§9.4]
F
\familydefault
Defined in: AT $_{E} X$ Kernel.
Specifies the default font family.

Defaults to \rmdefault but may be redefined by certain classes. [§8.2]
$\backslash$ fbox $\{\langle$ text $\rangle\}$
Defined in: ${ }^{\text {ET }} \mathrm{EX}$ Kernel.

| Symbols |  |  |

E
ST

Puts a frame around its contents， prohibiting a line break in the contents．［84．7］
\begin\｛figure\}[〈placement〉]
Defined in：Most classes that define sectioning commands．

Floats the contents to the nearest location according to the preferred placement options，if possible．Within the environment， \caption may be used one or more times，as required．The caption will usually include the prefix given by \figurename．［§7．1］
$\backslash$ figurename
Defined in：Classes or packages that define figures．

Number prefix used in figure captions．［§8．2］
$\backslash$ fnsymbol $\{\langle$ counter $\rangle\}$
Defined in： $\mathrm{LT}_{\mathrm{E}} \mathrm{X}$ Kernel．
Displays counter value as footnote symbol．（＊$\dagger \ddagger$ § $\boldsymbol{T} \|$＊＊† $\ddagger$ ）［§11．0］
$\backslash$ footnote［〈number $\rangle]\{\langle$ text $\rangle\}$
Defined in： $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel．
Inserts a footnote．［§4．1］
$\backslash$ footnotesize
Defined in：Most document classes．

Switches to footnote sized text．
［§4．5］
$\backslash$ forall
Defined in： LATEX Kernel（Math Mode）．
＂For all＂$\forall$ symbol．［§9．4］

| Symbols |  |  |
| :---: | :---: | :---: |
| A | N |  |
| B | O |  |
| C | P |  |

$\backslash$ foreignlanguage\｛〈language name $\rangle\}\{\langle$ text $\rangle\}$
Defined in：babel package．
Typesets the given text using any predefined names or date formats supplied by the given language． ［§5．8］
$\backslash$ frac $\{\langle$ numerator $\rangle\}$
\｛〈denominator $\rangle\}$
Defined in： $\mathrm{ETPX}_{E}$ Kernel（Math Mode）．
Displays a fraction．［§9．4］
$\backslash$ framebox［〈width $\rangle$ ］［〈align $\rangle$ ］ $\{\langle$ text $\rangle\}$
Defined in： ATEX Kernel．$^{2}$
Puts a frame around its contents， prohibiting a line break in the contents．［§4．7］
$\backslash$ frenchspacing
Defined in： ATTEX Kernel．$^{2}$
Switch to French spacing．［§2．13］
\frontmatter
Defined in：Most book－style classes，such as scrbook．

Switches to lower case Roman numeral page numbering．Also suppresses chapter and section numbering，but still adds unstarred sectional units to the table of contents．（See also \mainmatter and \backmatter．）［§5．7］
$\backslash$ frown
Defined in： LATEX Kernel（ $^{2}$ Math Mode）． Relational $\frown$ symbol．［§9．4］
s

 RUvY
Z Z

| $\backslash$ Gamma G | Relational $\geq$ symbol. [§9.4] | Symbols |
| :---: | :---: | :---: |
|  |  | A N |
|  | $\backslash \mathrm{geq}$ | B O |
| Defined in: ETEX Kernel (Math Mode). | Defined in: ${ }^{\text {ATPX Kernel (Math }}$ | $\begin{array}{ll}\text { C } & \mathrm{P} \\ \mathrm{D} & \mathrm{Q}\end{array}$ |
| Greek upper case gamma Г. [§9.4] | Relational $\geq$ symbol. [§9.4] | $\begin{array}{ll}\text { E } & \text { R } \\ \text { F } & \text { S }\end{array}$ |
| $\backslash \mathrm{gamma}$ | $\backslash \mathrm{gets}$ | G T |
| Defined in: ${ }^{\text {ATEX }}$ E Kernel (Math Mode). | Defined in: ${ }^{\text {ATPX }}$ Kernel (Math Mode). | $\begin{array}{cc}\text { H } & \mathrm{U} \\ \text { I } & \mathrm{V} \\ \mathrm{J} & \mathrm{W}\end{array}$ |
| Greek lower case gamma $\gamma$. [§9.4] | Left arrow $\leftarrow .[\$ 9.4]$ | K X |
| $\backslash \mathrm{gcd}$ | \gg | $\begin{array}{cc}\text { L } & \mathrm{Y} \\ \mathrm{M} & \mathrm{Z}\end{array}$ |
| Defined in: ETEX Kernel $^{\text {(Math }}$ Mode). | Defined in: ETEX Kernel (Math Mode). |  |
| Typesets gcd function name (may have limits via _ or ^). [§9.4] | Relational > symbol. [§9.4] |  |
| \ge | H |  |
| Defined in: ${ }^{\text {AT }}$ EX Kernel (Math Mode). | $\backslash H\{\langle c\rangle\}$ Defined in: LATEX Kernel. |  |

Double acute diacritic over $\langle c\rangle$.
Example: $\backslash \mathrm{H}\{\mathrm{o}\}$ produces ő. [§4.3]
$\backslash$ heavyrulewidth
Defined in: booktabs package.
Length register specifying the thickness of \toprule and \bottomrule. [§4.6]
\hom
Defined in: ETEX Kernel (Math Mode).

Typesets hom function name.
[§9.4]
\hookleftarrow
Defined in: ETEX Kernel (Math
Mode).
Hooked left arrow $\hookleftarrow$. [§9.4]
\hookrightarrow
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Hooked right arrow $\hookrightarrow$. [§9.4]
\hspace\{〈length $\rangle\}$
Defined in: ${ }^{A T} T_{\mathrm{E}} \mathrm{X}$ Kernel.
Inserts a horizontal gap of the given width. [§4.6]
$\backslash$ Huge
Defined in: Most document classes.

| Symbols |  |
| :---: | :---: |
| A | N |
| B | O |
| C | P |
| D | Q |
| E | R |
| F | S |
| G | T |
| H | U |
| I | V |
| J | W |
| K | X |
| L | Y |
| M | Z |

Switches to extra-huge sized text. [84.5]
\huge
Defined in: Most document classes.

Switches to huge sized text. [§4.5]
$\backslash$ hyphenation $\{\langle$ word $\rangle\}$
Defined in： AT $_{E} X$ Kernel．
Specifies hyphenation points．
［§2．14］
I
\i
Defined in： ETTEX Kernel．$^{2}$
Dotless i character：1．［§4．3］
\iflanguage\｛〈language
name $\rangle\}\{\langle$ true text $\rangle\}\{\langle$ false text $\rangle\}$
Defined in：babel package．
Tests the current language．［§5．8］
\ignorespaces
Defined in： $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel．
Used in begin environment code to suppress any spaces occurring at the start of the environment（see
also \ignorespacesafterend）． ［§10．0］
\ignorespacesafterend
Defined in： $\mathrm{ETT}_{\mathrm{E}} \mathrm{X}$ Kernel．
Used in end environment code to suppress any spaces following the end of the environment．［\＄10．0］
\in
Defined in：EATEX Kernel（Math Mode）．
Relational $\in$ symbol．［§9．4］
\includegraphics［〈key vals〉］\｛〈filename $\rangle\}$
Defined in：graphicx package．
Inserts a graphics file into the document．［§6．0］
\index $\{\langle$ text $\rangle\}$
Defined in：$A_{\text {TEX }}$ Kernel．

Adds indexing information to an external index file. The command $\backslash$ makeindex must be used in the preamble to enable this command. The external index file must be post-processed with an indexing application, such as makeindex. [88.0]
\indexname
Defined in: Classes or packages that define an index section.

Text used for index heading. [§8.2]
\inf
Defined in: ${ }^{\text {ETTEX Kernel (Math }}$ Mode).

Typesets inf function name (may have limits via _ or ${ }^{\wedge}$ ). [§9.4]
\infty
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Infinity $\infty$ symbol. [§9.4]
\injlim
Defined in: amsmath (Math Mode).
Typesets inj lim function name (may have limits via _ or ^). [§9.4]
\int
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).

Symbols
A $\quad \mathrm{N}$
B O
C $\quad \mathrm{P}$
D Q
E R
F S
G T
H U
I V

J W
K X
L Y
M Z

Integral $\int$ symbol (may take limits). [§9.4]
\intertext $\{\langle$ text $\rangle\}$
Defined in: amsmath package (Math Mode).
Used for a short interjection in the middle of a multi-line displayed
maths, such as in an align environment. May only appear right after $\backslash \backslash$. [§9.3]
\iota
Defined in: EATEX Kernel (Math $^{\text {P }}$ Mode).
Greek lower case iota $\boldsymbol{t}$. [§9.4]

- Defined in: ETEX Kernel.
Specifies the start of an item in a list. (Only allowed inside one of the list making environments.) [84.4]
\begin\{itemize\} }
Defined in: ETEX Kernel. \(^{\text {P }}\)
Unordered list. [§4.4]
\(\backslash\) begin\{itshape \(\}\)
Defined in: ETEX Kernel.

| Typesets the environment contents | Symbols |  |
| :--- | :---: | :---: |
| in an italic font. [§4.5] | A | N |
|  | B | O |
| \itshape | C | P |
| Defined in: LATEX Kernel. | D | Q |
| Switches to the italic form of the | E | R |
| current font family, if it exists. | F | S |
| [§4.5] | G | T |
|  | J | U |
|  | I | V |
| \j | J | W |
| Defined in: LATEX Kernel. | K | X |
| Dotless j character: j. $[\S 4.3]$ | M | Y |
|  |  | Z |

 K

$\backslash$ kappa
Defined in: LATEX Kernel $^{2}$ (Math Mode).
Greek lower case kappa $\kappa$. [§9.4]
$\backslash$ ker
Defined in: ETEX Kernel $^{2}$ (Math Mode).
Typesets ker function name. [§9.4]
L
\L
Defined in: AT $_{E} X$ Kernel.
Upper case L-bar Ł character.
[84.3]
\1
Defined in: AT $_{E} X$ Kernel.
Lower case l-bar $\Varangle$ character. [§4.3]
$\backslash$ label $\{\langle$ string $\rangle\}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Assigns a unique textual label linked to the most recently incremented cross-referencing
counter in the current scope (see also \ref). [§5.5]
$\backslash$ labelformat $\{\langle c t r\rangle\}\{\langle$ defn $\rangle\}$
Defined in: fncylab package.
Defines how the label for the counter $\langle$ ctr $\rangle$ should be formatted. The definition $\langle$ defn $\rangle$ should use \#1 to indicate the label value. [§7.4]
$\backslash$ labelitemi
Defined in: Classes that define the itemize environment.

The default label for the first level itemize. [§8.2]
\labelitemii
Defined in: Classes that define the itemize environment.
The default label for the second level itemize. [§8.2]
$\backslash$ labelitemiii
Defined in: Classes that define the itemize environment.
The default label for the third level itemize. [§8.2]
\labelitemiv
Defined in: Classes that define the itemize environment.
The default label for the fourth level itemize. [88.2]
$\backslash$ Lambda
Defined in: EATEX Kernel (Math Mode).
Greek upper case lambda $\Lambda$. [§9.4]
$\backslash l a m b d a$
 Mode).
Greek lower case lambda $\lambda$. [§9.4]
\langle
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Left-angled < delimiter. [§9.4]
$\backslash$ LARGE
Defined in: Most document classes.

Switches to extra-extra-large sized text. [§4.5]
$\backslash$ Large
Defined in: Most document classes.
Switches to extra-large sized text.
[84.5]
$\backslash$ large
Defined in: Most document classes.
Switches to large sized text. [§4.5]

K X
L Y
M
$\backslash$ LaTeX
Defined in: AT $_{E} X$ Kernel.
Typesets the ETEX logo. [§2.6]
$\backslash$ LaTeXe
Defined in: AT $_{E} X$ Kernel.
Typesets the $\mathrm{ET}_{\mathrm{E}} \mathrm{X} 2 \varepsilon$ logo. [§5.6]
\lceil
Defined in: LATEX Kernel (Math Mode).
Left ceil 「 delimiter. [§9.4]
$\backslash l$ dots
Defined in: ETEX Kernel.
Ellipses ... symbol. [84.3]
$\backslash l e$
 Mode).

Relational $\leq$ symbol. [§9.4]
$\backslash$ left $\langle$ delimiter $\rangle$
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Indicates a left stretchable
delimiter. Must have a matching \right. [§9.4]
\Leftarrow
Defined in: ETEX Kernel (Math Mode).
Double-lined left arrow $\Leftarrow$. [§9.4]

 \leftarrow

Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Left arrow $\leftarrow$. [§9.4]
\leftharpoondown
Defined in: ETEX Kernel (Math Mode).

Left down harpoon $\leftharpoondown$. [§9.4]
$\backslash$ leftharpoonup
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Left up harpoon $\leftharpoonup$. [§9.4]
\Leftrightarrow
Defined in: ETEX Kernel (Math Mode).

Double-ended double-lined
horizontal arrow $\Leftrightarrow$. [§9.4]
\leftrightarrow
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).

Double-ended horizontal arrow $\leftrightarrow$. [§9.4]
\leq
Defined in: ETEX Kernel (Math Mode).

Relational $\leq$ symbol. [§9.4]
\lfloor
Defined in: ETEX $_{\text {E }}$ Kernel (Math Mode).

Left floor $\lfloor$ delimiter. [§9.4]
$\backslash l g$
Defined in: ETEX Kernel $^{2}$ (Math Mode).

Typesets $\lg$ function name. [§9.4]
\lightrulewidth
Defined in: booktabs package.
Length register specifying the thickness of \midrule. [§4.6]
\lim
Defined in: ETEX $_{E}$ Kernel (Math Mode).

Typesets lim function name (may have limits via _ or ${ }^{\wedge}$ ). [§9.4]
$\backslash l i m i n f$
Defined in: ETEX Kernel (Math Mode).
Typesets lim inf function name (may have limits via _ or ^). [§9.4]
\limsup
Defined in: ETEX Kernel (Math Mode).

Typesets lim sup function name (may have limits via _ or ^). [§9.4]
\linebreak[ $\langle n\rangle$ ]
Defined in: ${ }^{A T} T_{E} X$ Kernel.
Requests a line break, ensuring the paragraph remains justified. This may cause excess white space in the paragraph. [§B.29]
\linewidth
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel.
A length containing the desired current line width. This is usually the width of the typeblock, but inside a minipage or $\backslash$ parbox it will be the width the box. Note that the actual contents of the line may fall short of the line width (underfull hbox) or extend beyond it (overfull hbox). [84.7]
\listfigurename
Defined in: Classes or packages that define a list of figures.
Text used for list of figures heading. [§8.2]

 \listoffigures

Defined in: Most classes that have the concept of document structure.

Inserts the list of figures. A second (possibly third) run is required to ensure the page numbering is correct. [§7.1]
\listoftables
Defined in: Most classes that have the concept of document structure.
Inserts the list of tables. A second (possibly third) run is required to ensure the page numbering is correct. [\$7.2]
\listtablename
Defined in: Classes or packages that define a list of tables.
Text used for list of tables heading. [§8.2]
\11
Defined in: ETEX Kernel (Math Mode).

Relational << symbol. [§9.4]
\ln
Defined in: ETEX $_{\text {E }}$ Kernel (Math Mode).

Typesets $\ln$ function name. [§9.4]
\log
Defined in: EATEX Kernel (Math Mode).
Typesets log function name. [§9.4]
\Longleftarrow

Defined in: EATEX Kernel (Math Mode).

Long double-lined left arrow $\Longleftarrow$. [§9.4]
\longleftarrow
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).

Long left arrow $\longleftarrow$. [§9.4]
\Longleftrightarrow
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Long double-lined double-ended horizontal arrow $\Longleftrightarrow$. [§9.4]
\longleftrightarrow
Defined in: ETEX Kernel (Math Mode).
Long double-ended horizontal arrow $\longleftrightarrow$. [§9.4]
$\backslash$ longmapsto
Defined in: ${ }^{A T} T_{E X}$ Kernel (Math Mode).
Long mapping arrow $\longmapsto$. [§9.4]
\Longrightarrow
Defined in: ETEX Kernel (Math Mode).

Long double-lined right arrow $\Longrightarrow$. [§9.4]
\longrightarrow
Defined in: ETEX Kernel (Math Mode).
Long right arrow $\longrightarrow$. [§9.4]
\lVert
Defined in: amsmath (Math Mode).
Left double vertical bar \| delimiter. [§9.4]
\lvert
Defined in: amsmath (Math Mode).
Left vertical bar | delimiter. [§9.4]

 M

$\backslash$ mainmatter
Defined in: Most book-style classes, such as scrbook.

Switches to Arabic page numbering and enables chapter and section numbering. (See also $\backslash$ frontmatter and \backmatter.) [§5.7]
$\backslash$ makeindex
Defined in: $\operatorname{AT}_{E} \mathrm{X}$ Kernel (Preamble Only).
Enables \index. [§8.0]
$\backslash$ maketitle
Defined in: Most classes that have the concept of a title page.
Generates the title page (or title block). This command is usually placed at the beginning of the document environment. [§5.1]
$\backslash$ mapsto
Defined in: ETEX Kernel (Math Mode).

Mapping arrow $\mapsto$. [§9.4]
$\backslash$ markboth\{〈left head $\rangle\}\{\langle$ right head)\}
Defined in: ATEX Kernel.
Specifies information for the left and right page headers. Not all page styles use this information, in which case the arguments are ignored. [85.7]
$\backslash$ markright $\{\langle$ right head $\rangle\}$
Defined in: ${ }^{A T} T_{E} X$ Kernel.
Symbols
A $\quad \mathrm{N}$
B O
C $\quad$ P
D $\quad$ Q
E R
F S
G T
H U
I V

J W
K X
L
M Z

Specifies information for the right (odd) page header. Not all page styles use this information, in which case the argument is ignored. [§5.7]
$\backslash$ begin \{math $\}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.

Sets its contents in in-line math mode. [§9.1]
$\backslash$ mathbb $\{\langle$ maths $\rangle\}$
Defined in: amsfonts package (Math Mode).
Typesets its argument in the blackboard bold font. Example: $\backslash(\backslash$ mathbb $\{\mathrm{R}\} \backslash)$ produces $\mathbb{R}$. [§9.4]
$\backslash$ mathbf\{ $\langle$ maths $\rangle\}$
Defined in: ${ }^{\text {AT }} \mathrm{T}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Renders $\langle$ maths $\rangle$ in the predefined maths bold font.
(Doesn't work with numbers and nonalphabetical symbols.) See also \boldsymbol. [§9.4]
$\backslash$ mathcal $\{\langle$ maths $\rangle\}$
Defined in: ETEX Kernel (Math Mode).

Typesets its argument in the maths calligraphic font. Example: $\backslash(\backslash$ mathcal $\{S\} \backslash)$ produces $S$. [§9.4]
$\backslash m a t h f r a k\{\langle m a t h s\rangle\}$
Defined in: amsfonts package (Math Mode).
Typesets its argument in Euler Fraktur letters. Example:
$\backslash(\backslash$ mathfrak $\{\mathrm{U}\} \backslash)$ produces $\mathfrak{U}$. [§9.4]
\mathit $\{\langle$ maths $\rangle\}$
Defined in: ETEX Kernel (Math Mode).
Renders $\langle$ maths $\rangle$ in the predefined maths italic font. [§9.4]
$\backslash$ mathrm\{〈maths $\rangle\}$
Defined in: ETTEX Kernel (Math Mode).

Symbols
A $\quad \mathrm{N}$
B O
C $\quad \mathbf{P}$
D $\quad$ Q
E $\quad$ R
F S
G T
H U
I V
J W
K X
L
M

Renders $\langle$ maths $\rangle$ in the predefined maths serif font. [§9.4]
$\backslash$ mathsf\{ $\langle$ maths $\rangle\}$
Defined in: ETEX Kernel (Math Mode).
Renders $\langle$ maths $\rangle$ in the predefined maths sans-serif font. [§9.4]
$\backslash$ mathtt $\{\langle$ maths $\rangle\}$
Defined in: ETEX Kernel (Math Mode).
Renders $\langle$ maths $\rangle$ in the predefined maths typewriter font. [§9.4]
\begin\{matrix\} }
Defined in: amsmath package (Math Mode).
Like the array environment, but doesn't have an argument. [§9.4]
$\backslash \max$
Defined in: ETTX $_{E}$ Kernel (Math Mode).
Typesets max function name (may have limits via _ or ^). [§9.4]
$\backslash \operatorname{mbox}\{\langle$ text $\rangle\}$
Defined in: ETEX Kernel.
Ensures that the given text doesn't contain a line break. [§4.7]
$\backslash$ mdseries
Defined in: ${ }^{[2 T} T_{E} X$ Kernel.
Switches to the medium weight in the current font family. [84.5]
$\backslash$ medspace
Defined in: amsmath package.
Medium space. [§9.4]
$\backslash$ mid
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).

Relational | symbol. [§9.4]
$\backslash$ midrule[ $\langle w d\rangle]$
Defined in: booktabs package.
Horizontal rule to go below headings row of a tabular environment. [§4.6]
$\backslash$ min
Defined in: ${ }^{2} T_{E} \mathrm{X}$ Kernel (Math Mode).

Typesets min function name (may have limits via _ or ${ }^{\wedge}$ ). [§9.4]
\begin\{minipage\}[ } \langle p o s \rangle ]
[〈height $\rangle]\{\langle$ width $\rangle\}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.

Makes a box with line-wrapped contents. (See also \parbox.) [§4.7]
$\backslash$ minisec $\{\langle$ heading $\rangle$ \}
Defined in: scrartcl, scrreprt and scrbook classes.
An unnumbered heading not associated with any structuring level. [§5.3]
$\backslash \bmod \{\langle$ maths $\rangle\}$
Defined in: amsmath (Math Mode).
Modulo operator without parentheses. [§9.4]
$\backslash$ models
Defined in: ETEX Kernel (Math Mode).
Relational $\mid=$ symbol. [§9.4]

Symbols
A $\quad \mathrm{N}$

Defines a new command．［§8．0］
$\backslash$ newcounter $\{\langle$ counter $\rangle\}[\langle$ outer counter $\rangle$ ］
Defined in： ATEX Kernel．$^{2}$
Defines a new counter．［\＄11．0］
\newenvironment \｛〈env－name〉\}
［〈n－args $\rangle][\langle$ default $\rangle]\{\langle$ begin－ code $\rangle\}\{\langle$ end－code $\rangle\}$
Defined in：${ }^{E} T_{E} X$ Kernel．
Defines a new environment．［\＄10．0］
$\backslash$ newline
Defined in： $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel．
Forces a line break．［§B．29］
\ni
Defined in： ETEX Kernel（Math $^{\text {P }}$ Mode）．
\noindent
Defined in： ETT $_{E} X$ Kernel．
Suppress the indentation that would usually occur at the start of the next paragraph．［§10．0］
$\backslash$ nonfrenchspacing
Defined in：${ }^{A T} T_{E} X$ Kernel．
Switch to English spacing．［§2．13］
\normalfont
Defined in：${ }^{A T} T_{E} X$ Kernel．
Switches to the default font style．
［84．5］
\normalsize
Defined in： ATT $_{E} X$ Kernel．
Switches to normal sized text．
［84．5］

Relational $\ni$ symbol．［§9．4］
$\backslash$ not $\langle$ symbol command $\rangle$
Defined in: ETEX Kernel (Math Mode).
Negates the following symbol.
Example: \not $\backslash$ subset produces $\not \subset$. [§9.4]
$\backslash$ notag
Defined in: amsmath package.
Suppresses equation numbering for the current row in
environments such as align. [§9.3]
$\backslash$ notin
Defined in: ETEX Kernel (Math Mode).
Relational $\ddagger$ symbol. [§9.4]
$\backslash n u$
Defined in: ETEX Kernel (Math Mode).

| Gr | Symbols |
| :---: | :---: |
|  | A N |
| $\backslash$ nwarrow | B O |

| North-West arrow \. [§9.4] | E R |
| O | G T |
| 10 | H U |
| $\backslash 0$ | V |
| Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel. | W |
| Upper case slashed-O $\varnothing$ character. | K X |
| [84.3] | $\begin{array}{cc}\text { L } & \mathrm{Y} \\ \mathrm{M} & \mathrm{Z}\end{array}$ |

Greek lower case nu v. [§9.4]

Defined in: ATEX Kernel. $^{\text {E }}$
Lower case slashed-o ø character. [84.3]
\odot
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
\o

Operator $\odot$ symbol. [§9.4]
\OE
Defined in: ${ }^{\text {ATEX }}$ Kernel.
© ligature. [84.3]
\oe
Defined in: ATTEX Kernel. $^{2}$
œ ligature. [84.3]
\oint
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Closed path integral $\oint$ symbol (may take limits). [§9.4]
$\backslash$ Omega
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Greek upper case omega $\Omega$. [§9.4]
\omega
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Greek lower case omega $\omega$. [§9.4]
\ominus
Defined in: LATE $_{E} X$ Kernel (Math Mode).
Operator $\ominus$ symbol. [§9.4]
\oplus
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Operator $\oplus$ symbol. [§9.4]
\oslash
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Operator $\oslash$ symbol. [§9.4]
\begin\｛otherlanguage\}
\｛〈language name）\}
Defined in：babel package．
Within the environment contents， predefined textual elements，such as the date given by \today or prefixes like＂Chapter＂，are set to those supplied by the given language．［§5．8］
\otimes
Defined in： $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel（Math Mode）．

Operator $\otimes$ symbol．［§9．4］
$\backslash 0 v a l b o x\{\langle t e x t\rangle\}$
Defined in：fancybox package．
Puts a thick－lined oval frame around its contents，prohibiting a line break in the contents．［§4．7］
\ovalbox\｛ $\{\langle$ text $\rangle\}$
Defined in：fancybox package．
Puts a thin－lined oval frame around its contents，prohibiting a line break in the contents．［84．7］
\overleftarrow\｛〈maths〉\}
Defined in：ETEX Kernel（Math Mode）．
Puts an extendible left arrow over〈maths〉［§9．4］
\overleftrightarrow\｛〈maths〉\}

Symbols
A $\quad \mathrm{N}$
B O
C $\quad \mathrm{P}$
D Q
E R

H U
I V
J W
K X
L
M
Defined in：amsmath package （Math Mode）．
Puts an extendible left－right arrow over 〈maths〉［§9．4］
\overrightarrow\｛〈maths〉\}
Defined in：ETEX Kernel（Math Mode）．

Puts an extendible right arrow over $\langle$ maths $\rangle$［§9．4］

P
$\backslash P$
Defined in： ATTEX Kernel．$^{2}$
Paragraph II symbol．［§4．3］
$\backslash$ pagenumbering $\{\langle$ style $\rangle$ \}
Defined in： $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel．
Sets the style of the page numbers． ［§5．7］
$\backslash$ pageref\｛ $\{$ string $\rangle\}$
Defined in：ETEX Kernel．
Similar to \ref but inserts the page number where the given label was defined．A second （possibly third）run of $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ is required to ensure the
cross－references are up－to－date． ［85．5］
\pagestyle\｛〈style〉\}
Defined in： ATEX Kernel $^{2}$
Sets the style of the headers and footers．［§5．7］
$\backslash \mathrm{par}$
Defined in： ATEX Kernel．$^{\text {P }}$
Insert a paragraph break．［§4．0］
$\backslash$ paragraph［〈short title $\rangle]\{\langle$ title $\rangle\}$

Symbols
A $\quad \mathrm{N}$
B O
C $\quad \mathrm{P}$
D $\quad$ Q
E R
F S
G T
H U
I V
J W
K X
L
M

Defined in：Most classes that have the concept of document structure．
Inserts a subsubsubsection header． Most classes default to an unnumbered running header for this sectional unit．This command has a moving argument．［85．3］
$\backslash$ parallel
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Relational || symbol. [§9.4]
\parbox[ $\langle$ pos $\rangle$ ][ $\langle$ height $\rangle]$
$\{\langle$ width $\rangle\}\{\langle$ text $\rangle\}$
Defined in: ${ }^{~ E T} T_{E} X$ Kernel.
Makes a box with line-wrapped contents. (More restrictive than minipage.) [84.7]
$\backslash$ parindent
Defined in: ETEX Kernel. $^{\text {E }}$
A length register that stores the indentation at the start of paragraphs. [§2.17]
\parskip
Defined in: ${ }^{\text {ATEX K }}$ Kernel.

A length register that stores the spacing between paragraphs. (If you're using one of the KOMA-Script classes, use the parskip option to set it to full or half line height.) [§2.17]
$\backslash$ part [〈short title $\rangle]\{\langle$ title $\rangle\}$
Defined in: Most classes that have the concept of document structure. Inserts a part sectional unit. This command has a moving argument. [§5.3]
\partial
Defined in: ETEX Kernel (Math Mode).
Partial $\partial$ symbol. [§9.4]
$\backslash$ partname
Defined in: Classes or packages that define parts with a number
prefix.
Number prefix used in part
headings. [88.2]
$\backslash$ per
Defined in: ETEX Kernel (Math Mode).
Relational $\perp$ symbol. [§9.4]
$\backslash$ Phi
Defined in: ETEX Kernel $^{2}$ (Math Mode).
Greek upper case phi Ф. [§9.4]
$\backslash$ phi
Defined in: ETEX Kernel (Math Mode).
Greek lower case phi $\phi$. [§9.4]
$\backslash$ Pi
Defined in: EATEX Kernel (Math
Mode).

Greek upper case pi П. [§9.4]
$\backslash$ pi
Defined in: ETEX Kernel (Math Mode).
Greek lower case pi $\pi$. [§9.4]
\pm
Defined in: ETEX Kernel (Math Mode).
Operator $\pm$ symbol. [§9.4]
$\backslash$ begin\{pmatrix\}
Defined in: amsmath package (Math Mode).

Like the array environment, but doesn't have an argument and adds round bracket delimiters. [§9.4]

 Abstract

P
ST
U
V
W
X
Y
Z
$\backslash$ pmb \{ $\langle$ symbol $\rangle$ \}
Defined in: amsmath package (Math Mode).
"Poor man's bold." Overlays multiple copies of the symbol to produce a bold effect for symbols that don't work with $\backslash$ boldsymbol. [§9.4]
$\backslash \operatorname{pmod}\{\langle\operatorname{maths}\rangle\}$
Defined in: ${ }^{A T} T_{E} X$ Kernel (Math Mode).
Modulo operator with parentheses. [§9.4]
$\backslash \operatorname{pod}\{\langle$ maths $\rangle\}$
Defined in: amsmath (Math Mode).
Modulo operator with parentheses but no "mod". [§9.4]
$\backslash$ pounds
Defined in: ATEX Kernel. $^{\text {I }}$

Pound £ symbol. [§4.3]
$\backslash \operatorname{Pr}$
Defined in: ETEX Kernel (Math Mode).
Typesets Pr function name (may have limits via _ or ^). [§9.4]
$\backslash$ prec
Defined in: ATEX Kernel (Math $^{\text {P }}$ Mode).
Relational $\prec$ symbol. [§9.4]
$\backslash$ preceq
Defined in: ETEX Kernel (Math Mode).
Relational $\preceq$ symbol. [§9.4]
$\backslash$ printindex
Defined in: makeidx package.

Prints the index. Must be used with \makeindex and \index. (The external index file must first be processed by an indexing application.) [§8.0]
\prod
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).

Product $\prod$ symbol (may take limits). [§9.4]
\projlim
Defined in: amsmath (Math Mode).
Typesets proj lim function name (may have limits via _ or ^). [§9.4]
$\backslash$ propto
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
\protect $\langle$ command $\rangle$

Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel.
Used in a moving argument to prevent a fragile command from expanding. [§2.9]
$\backslash$ Psi
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).

Greek upper case psi $\Psi$. [§9.4]
$\backslash p s i$
Defined in: ${ }^{\mathrm{ET}} \mathrm{T}_{\mathrm{E}} \mathrm{X}$ Kernel (Math

Symbols
A N
B O
C $\quad \mathbf{P}$
D $\quad$ Q
E $\quad$ R
F S
G T
H U
I V
J W
K X
L
M Mode).

Greek lower case psi $\psi$. [§9.4]
$\backslash$ publishers $\{\langle$ tex $t\rangle\}$
Defined in: scrartcl, scrreprt, scrbook classes.

Relational $\propto$ symbol. [§9.4]

Specifies the publisher (typeset after all the other titling information). [§5.1]

 Q

\qquad
Defined in: ATEX Kernel. $^{2}$
Horizontal spacing command (twice as wide as \quad). [§9.4]
\quad
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Horizontal spacing command equal to the current font's em value. [§9.4]

 R

$\backslash r\{\langle c\rangle\}$
Defined in: $\mathrm{AT}_{\mathrm{EX}}$ Kernel.
Ring over $\langle c\rangle$. Example: $\backslash r\{u\}$ produces ů. [§4.3]
$\backslash$ raggedleft
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel.
Ragged-left paragraph justification. [§2.12]
\raggedright
Defined in: ATEX Kernel. $^{\text {E }}$
Ragged-right paragraph justification. [§2.12]
\rangle
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).

Symbols
A $\quad \mathrm{N}$
B O
C $\quad \mathbf{P}$
D Q
E R
F S
G $\quad$ T
H U
I V

J W
K X
L Y
M Z

Right-angled > delimiter. [§9.4]
\rceil
Defined in: ETTEX Kernel (Math $^{\text {P }}$ Mode).
Right ceil $\rceil$ delimiter. [§9.4]
$\backslash$ ref $\{\langle$ string $\rangle\}$
Defined in： ETTEX Kernel．$^{2}$
References the value of the counter linked to the given label． A second（possibly third）run of $\mathrm{LAT}_{\mathrm{E}} \mathrm{X}$ is required to ensure the cross－references are up－to－date． ［§5．5］
$\backslash$ reflectbox $\{\langle$ tex $t\rangle\}$
Defined in：graphicx package．
Reflects the specified contents in the $y$－axis．）［§6．1］
$\backslash$ refname
Defined in：Article style classes that define a bibliography section．
Text used for bibliography section heading．（See also \bibname．） ［88．2］
$\backslash$ refstepcounter $\{\langle$ counter $\rangle$ \}
Defined in： ETTEX Kernel．$^{2}$
Increments the value of the given counter by one and allows the counter to be cross－referenced using \ref and \label．［§11．0］
$\backslash$ renewcommand $\{\langle c m d\rangle\}[\langle$ n－args $\rangle]$ ［〈default $\rangle]\{\langle$ text $\rangle\}$
Defined in： $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel．
Redefines an existing command． ［§8．2］
\renewenvironment \｛〈env－name〉\}
［〈n－args $\rangle][\langle$ default $\rangle]\{\langle$ begin－ code）\} \{end-code\}
Defined in：${ }^{\text {ATEX K }}$ Kernel．
Redefines an existing environment．［§10．1］

| $\begin{aligned} & \text { \resizebox }\{\langle h \text { length }\rangle\}\{\langle v \\ & \text { length }\rangle\}\{\langle\text { text }\rangle\} \end{aligned}$ | Indicates a right stretchable delimiter. Must have a matching \left. [§9.4] | Symbols |
| :---: | :---: | :---: |
|  |  | A N |
|  |  | B O |
| Scales the specified contents to the given dimensions. [86.1] |  | C $\quad$ P |
|  | $\backslash$ Rightarrow | D Q |
|  | Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math | E R |
|  | Mode). | F S |
| \rfloor | Double-lined right arrow $\Rightarrow$. [§9.4] | $\begin{array}{ll}\text { G } & \text { T } \\ \text { H }\end{array}$ |
| Mode). | $\backslash$ rightarrow | V |
| Right floor 」 delimiter. [§9.4] | Defined in: ETTEX Kernel (Math Mode). | $\begin{array}{ll}\text { J } & \text { W } \\ \text { K } & \text { X }\end{array}$ |
| $\backslash$ rho |  | L |
| Defined in: ${ }^{\text {ETEX }}$ EX Kernel (Math Mode). | Right arrow $\rightarrow$. [§9.4] | M Z |
|  | $\backslash$ rightharpoondown |  |
| Greek lower case rho $\rho$. [§9.4] | Defined in: ${ }^{2 T} T_{E X}$ Kernel (Math Mode). |  |
| $\backslash$ right $\langle$ delimiter 〉 | Right down harpoon $\urcorner$. [§9.4] |  |
| Defined in: ${ }^{\mathrm{ET}}$ EX Kernel (Math Mode). | $\backslash$ rightharpoonup |  |
|  | Defined in: EATEX Kernel (Math Mode). |  |

Right up harpoon $\rightarrow$. [§9.4]
\rightleftharpoons
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Right-left harpoons $\rightleftharpoons$. [§9.4]
$\backslash$ rmdefault
Defined in: ${ }^{\text {ATEX }}$ Kernel.
The name of the default serif family as used by $\backslash$ rmfamily. Defaults to cmr (Computer Modern Roman). [88.2]
\rmfamily
Defined in: AT $_{E} X$ Kernel.
Switches to the predefined serif
font. (Defaults to Computer
Modern Roman.) [84.5]
$\backslash$ Roman $\{\langle$ counter $\rangle\}$
Defined in: ATEX Kernel. $^{\text {P }}$

| splays counter value as an uppe | Symbols |
| :---: | :---: |
| case Roman number. (I, II, III, ...) | A N |
| [§11.0] | B O |
|  | C |
| $\backslash$ roman $\{\langle$ counter $\rangle$ \} | D Q |
| Defined in: ETEX Kernel. | E R |
| Displays counter value as a lowe | F |
| case Roman number. (i, ii, iii, ...) | H |
| [§11.0] | I V |
|  | J W |
| $\text { list }\rangle]\{\langle\text { angle }\rangle\}\{\langle\text { tex } t\rangle\}$ | K X |
| Defined in: graphicx package. | $\begin{array}{ll}\text { L } & \mathrm{Y} \\ \mathrm{M} & \mathrm{Z}\end{array}$ |

Rotates the given contents by the given angle. [§6.1]
\rVert
Defined in: amsmath (Math Mode).
Right double vertical bar \| delimiter. [§9.4]
\rvert
Defined in: amsmath (Math Mode).
Right vertical bar | delimiter. [§9.4]

 S

 \S

Defined in: ETTEX Kernel. $^{2}$
Sectional § symbol. [§4.3]
$\backslash \mathrm{sb}\{\langle$ maths $\rangle\}$
Defined in: ETTEX Kernel (Math $^{\text {P }}$ Mode).
Displays its argument as a subscript. [§9.4]
$\backslash$ scalebox $\{\langle h$ scale $\rangle\}[\langle v$ scale $\rangle]\{\langle$ text $t\rangle\}$
Defined in: graphicx package.
Scales the specified contents. [§6.1]

|  | Symbols |  |
| :--- | :---: | :---: |
| \scriptsize | A | N |
| Defined in: Most document | B | O |
| classes. | C | P |
| Switches to sub- or superscript | D | Q |

| South-East arrow \.[§9.4] |  |  |
| \sec |  |  |
| Defined in: LATEX Kernel (Math |  |  |
| Mode). |  |  |
| Typesets sec function name. [§9.4] |  |  |

\section［〈short title〉］\｛〈title〉\}

Defined in：Most classes that have the concept of document structure．
Inserts a section header．This command has a moving argument．［§5．3］
\selectlanguage\｛〈language name）$\}$
Defined in：babel package．
Switches to the named language． Predefined textual elements，such as the date given by \today or prefixes like＂Chapter＂，are redefined to those supplied by the given language．［§5．8］
\setcounter\｛〈counter〉\}
\｛〈number〉\}
Defined in：${ }^{A T} T_{E} X$ Kernel．
Sets the value of a counter．［§11．0］
\setlength\｛〈register $\rangle\}$
\｛dimension〉\}
Defined in：ETEX Kernel．
Sets the value of a length register． ［§2．17］
\setminus
Defined in： ETE $_{E} X$ Kernel（Math Mode）．

Operator \symbol．［§9．4］
\sfdefault
Defined in：${ }^{A T} T_{E} X$ Kernel．

Symbols
A N
B O
C $\quad$ P
D $\quad$ Q
E R
F S
G T
H U
I V
J W
K X
L Y
M Z

The name of the default sans－serif family as used by \sffamily．
Defaults to cmss（Computer Modern Sans－serif）．［§8．2］
\sffamily
Defined in：${ }^{\text {ATEX K }}$ Kernel．

Switches to the predefined sans-serif font. (Defaults to Computer Modern Sans.) [§4.5]
$\backslash$ shadowbox $\{\langle$ text $\rangle\}$
Defined in: fancybox package.
Puts a shadow frame around its contents, prohibiting a line break in the contents. [§4.7]
\begin\{sidewaysfigure\} }
Defined in: rotating package.
Like the figure environment but rotates the entire figure (including caption) sideways. [87.3]
\begin\{sidewaystable\} }
Defined in: rotating package.
Like the table environment but rotates the entire table (including caption) sideways. [87.3]
$\backslash$ Sigma
Defined in: ${ }^{\mathrm{AT}} \mathrm{T}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).

Greek upper case sigma $\Sigma$. [§9.4]
\sigma
Defined in: LATE $_{E} X$ Kernel (Math Mode).
Greek lower case sigma $\sigma$. [§9.4]
\sim
Defined in: EAT $_{E} X$ Kernel (Math Mode).

Relational ~ symbol. [§9.4]
$\backslash$ simeq
Defined in: ETTEX Kernel (Math $^{\text {P }}$ Mode).
Relational $\simeq$ symbol. [§9.4]
$\backslash$ sin
Defined in: ETEX $_{E}$ Kernel (Math Mode).
Typesets sin function name. [§9.4]
$\backslash$ sinh
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Typesets sinh function name. [§9.4]
\slash
Defined in: AT $_{E} X$ Kernel.
Forward slash / symbol. [§4.3]
\slshape
Defined in: ATEX Kernel. $^{2}$
Switches to the slanted form of the current font family, if it exists. [§4.5]
\small
Defined in: Most document classes.

Switches to small sized text. [§4.5]
$\backslash$ begin\{smallmatrix\}
Defined in: amsmath package (Math Mode).
Like the array environment but doesn't have an argument and is designed for in-line maths. [§9.4]
$\backslash$ smile
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Relational $\smile$ symbol. [§9.4]
\sp\{$\{$ maths $\rangle\}$
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).

Displays its argument as a superscript. [§9.4]
\sqcap
Defined in: ETEX Kernel (Math Mode).
Operator $\square$ symbol. [§9.4]
\sqcup
Defined in: ETEX Kernel $^{\text {(Math }}$ Mode).
Operator $\sqcup$ symbol. [§9.4]
\sqrt[ $\langle$ order $\rangle]\{\langle$ operand $\rangle\}$
Defined in: ETEX Kernel (Math Mode).
Displays a root. [§9.4]
\sqsubseteq
Defined in: EATEX Kernel (Math Mode).

Relational $\sqsubseteq$ symbol. [§9.4]
\sqsupseteq
Defined in: ETEX Kernel (Math Mode).
Relational $\sqsupseteq$ symbol. [§9.4]

 \SS

Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
SS (upper case B). [§4.3]
\ss
Defined in: ETEX Kernel. $^{2}$
Eszett $ß$ character. [84.3]
\star
Defined in: $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Operator $\star$ symbol. [§9.4]
\stepcounter $\{\langle$ counter $\rangle\}$
Defined in： ETEX Kernel $^{2}$
Increments the value of the given counter by one．［\＄11．0］
\begin\｛subfigure\}[〈pos〉] \｛〈width $\rangle$ \}
Defined in：subcaption package．
Used to form a subfigure within a figure environment．The \caption command may be used in this environment to produce a subcaption．［87．4］
$\backslash$ subject $\{\langle$ text $\rangle\}$
Defined in：scrartcl，scrreprt，scrbook classes．
Specifies the subject（typeset just above the title）．［§5．1］
\subparagraph［〈short title $\rangle$ ］$\{\langle$ title $\rangle\}$
Defined in：Most classes that have the concept of document structure． Inserts a subsubsubsubsection header．Most classes default to an unnumbered running header for this sectional unit．This command has a moving argument．［§5．3］
\subref\｛〈label $\rangle\}$
Defined in：subcaption package．
Analogous to \ref but only references the subfigure or subtable caption．［87．4］

\subsection［〈short title〉］\｛〈title〉\}

Defined in：Most classes that have the concept of document structure． Inserts a subsection header．This command has a moving argument．［§5．3］
\subset
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Subset $\subset$ symbol. [§9.4]
$\backslash$ subseteq
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Relational $\subseteq$ symbol. [§9.4]
\substack \{ $\langle$ maths $\rangle\}$
Defined in: amsmath package.
Can be used to produce a multiline subscript or superscript. Lines are separated using <br>\. [§9.4]
\subsubsection[\{short title $\rangle]\{\langle$ title $\rangle\}$
Defined in: Most classes that have the concept of document structure.

Inserts a subsubsection header.
This command has a moving argument. [§5.3]
\begin\{subtable\}[(pos } \rangle ] \{〈width $\rangle$ \}
Defined in: subcaption package.
Used to form a subtable within a table environment. The \caption command may be used in this environment to produce a subcaption. [87.4]
$\backslash$ subtitle $\{\langle$ text $\rangle\}$

Defined in: scrartcl, scrreprt, scrbook classes.
Specifies the subtitle (typeset just below the title). [§5.1]
\succ
Defined in: ETEX Kernel (Math Mode).

| Relational $\succ$ symbol. [§9.4] | Relational $\supset$ symbol. [§9.4] | Symbols |
| :---: | :---: | :---: |
| \succeq |  | A N |
| Defined in: LATEX Kernel (Math |  | C |
| Mode). | Defined in: AlEX Kernel (Math Mode). | D $\quad$ Q |
| Relational $\succeq$ symbol. [§9.4] | Relational $\supseteq$ symbol. [§9.4] | $\begin{array}{ll}\text { E } & \text { R } \\ \text { F } & \text { S }\end{array}$ |
| $\backslash$ sum | \swarrow | G |
| Defined in: ETEX Kernel $^{\text {(Math }}$ Mode). | Defined in: EATEX Kernel (Math Mode). | $\begin{array}{cc}\text { H } & \text { U } \\ \text { I } & \mathrm{V} \\ \text { J } & \mathrm{W}\end{array}$ |
| Summation $\sum$ symbol (may take limits). [§9.4] | South-West arrow $\swarrow$. [§9.4] | $\begin{array}{ll}\text { K } & \text { X } \\ \text { L } & \mathrm{Y}\end{array}$ |
| $\backslash$ sup | T | M Z |
| Defined in: LATEX Kernel (Math | \t $\{\langle$ characters $\rangle$ \} |  |
| Mode). | Defined in: ETEX Kernel. |  |
| Typesets sup function name (may have limits via _ or ${ }^{\wedge}$ ). [§9.4] | Tie over $\langle$ characters〉. Example: $\backslash t\{x y\}$ produces $\overline{x y}$. [§4.3] |  |
| $\backslash$ supset | \tabcolsep |  |
| Defined in: ETEX Kernel $^{\text {(Math }}$ Mode). | Defined in: ETEX Kernel. |  |

Length register specifying half the gap between columns in a tabular environment．［§4．6］
\begin\｛table\}[〈placement $\rangle$ ］
Defined in：Most classes that define sectioning commands．
Floats the contents to the nearest location according to the preferred placement options，if possible．Within the environment， \caption may be used one or more times，as required．The caption will usually include the prefix given by \tablename．［\＄7．2］
\tablename
Defined in：Classes or packages that define tables．

Number prefix used in table captions．［§8．2］
\tableofcontents
Defined in：Most classes that have the concept of document structure．

Inserts the table of contents．A second（possibly third）run is required to ensure the page numbering is correct．［§5．4］
\begin\｛tabular\}[〈v-pos $\rangle$ ］ \｛〈column specifiers）\}
Defined in： $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel（Text Mode）．

Environment for lining things up in rows and columns．Use array for math mode．［\＆4．6］
\tabularnewline
Defined in： $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel．
Behaves like <br>
in a tabular－like environment but helps to
disambiguate a line break in a paragraph cell from a row
separator. [§4.6]
$\backslash \operatorname{tag}\{\langle\operatorname{tag}\rangle\}$
Defined in: amsmath package.
Overrides equation numbering for the current row in environments such as align. [§9.3]
$\backslash$ tan
Defined in: $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Typesets $\tan$ function name. [§9.4]
\tanh
Defined in: LATEX Kernel (Math Mode).
Typesets tanh function name. [§9.4]
Tupesets fan
\tau
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Greek lower case tau $\tau$. [§9.4]
\TeX
Defined in: ${ }^{A T} T_{E} X$ Kernel.
Typesets the $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ logo. [§2.6]
\text $\{\langle$ text $\rangle\}$
Defined in: amsmath package (Math Mode).

Displays its argument in the normal text font (as opposed to the current maths font). [§9.2]
ˆ
Defined in: AT $_{E} \mathrm{X}$ Kernel.
Circumflex ^ symbol. [84.3]

| Symbols |  |  |
| :---: | :---: | :---: |
| A | N |  |
| B | O |  |
| C | P |  |
| D | Q |  |
| E | R |  |
| F | S |  |
| G | T |  |
| H | U |  |
| I | V |  |
| J | W |  |
| K | X |  |
| L | Y |  |
| M | Z |  |

M Z
̃
Defined in: AT $_{E} X$ Kernel.
Tilde $\sim$ symbol. (If you are typing an URL, use the url package, which provides \url\{\{address $\rangle\}$ that allows you to directly type $\sim$ in the address.) [84.3]
\
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel (Text Mode).
Backlash \symbol. (Use \backslash for math mode.) [84.3]
|
Defined in: ATEX Kernel. $^{2}$
Vertical bar | symbol. [§4.3]
$\backslash t e x t b f\{\langle$ text $\rangle\}$
Defined in: $\mathrm{AT}_{\mathrm{EX}}$ Kernel.

Renders $\langle$ text $\rangle$ with a bold weight in the current font family, if it exists. [84.5]
•
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel (Text Mode).

Bullet • symbol. [84.3]

\textcolor[\langlemodel\rangle]{\langlespecs\rangle}
{\langletext\rangle}

Defined in: color and xcolor packages.

Symbols
A $\quad \mathrm{N}$
B O
C $\quad$ P
D $\quad$ Q
E R
F S
G T
H U
I V
J W
K X
L
M Z

Sets $\langle$ text $\rangle$ with the foreground colour according to the given $\langle$ specs $\rangle$. [§8.0]
—
Defined in: ${ }^{\text {ETTEX Kernel. }}$
Em-dash - symbol. (Normally used to indicate omissions or
interruptions or to highlight a parenthetical element.) See also ---. [§4.3]
–
Defined in: ATEX Kernel $^{2}$
En-dash - symbol. (Normally used for number ranges.) See also --. [84.3]
¡
Defined in: ${ }^{[T T} T_{E} X$ Kernel.
Upside-down exclamation mark i symbol. [§4.3]
>
Defined in: ATEX Kernel (Text $^{\text {P }}$ Mode).
Greater than > symbol. (Just use > in math mode.) [§4.3]
\textheight
Defined in: ETT $_{E} X$ Kernel.
A length containing the height of the typeblock. Note that the actual contents of the page may fall short of the text height (underfull vbox) or extend beyond it (overfull vbox). This measurement does not include the header and footer areas. [§6.0]
\textit $\{\langle$ text $\rangle\}$
Defined in: ATEX Kernel $^{2}$

Symbols
A $\quad \mathrm{N}$
B O
C $\quad$ P
D $\quad$ Q

F S
G $\quad$ T
H U
I V

J W
K X
L
M Z

Renders $\langle$ text $\rangle$ with the italic form of the current font family, if it exists. [84.5]
<
Defined in: ETEX Kernel (Text $^{\text {P }}$ Mode).

Less than < symbol. (Just use < in math mode.) [§4.3]
\textmd\{〈text〉\}
Defined in: ETEX Kernel.
Renders $\langle$ text $\rangle$ with a medium weight in the current font family. [84.5]
$\backslash$ textnormal $\{\langle$ text $\rangle\}$
Defined in: ${ }^{\text {ATEX Kernel. }}$
Renders $\langle$ text $\rangle$ in the default font style. [§4.5]
·
Defined in: EATEX Kernel (Text Mode).
Centred period • symbol. [§4.3]
¿
Defined in: ${ }^{\text {ETEX Kernel. }}$

Upside-down question mark ; symbol. [§4.3]
“
Defined in: $\mathrm{LATEX}^{\mathrm{E}}$ Kernel.
Opening double quote " symbol. [84.3]
”
Defined in: LATEX Kernel.
Closing double quote " symbol. [84.3]
‘
Defined in: $\mathrm{LATEX}^{\mathrm{X}}$ Kernel.
Opening single quote ' symbol. [84.3]
’
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.

Closing single quote (or apostrophe) ' symbol. [§4.3]
®
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Registered © symbol. [84.3]
\textrm\{ $\{$ text $\rangle\}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Renders $\langle$ text $\rangle$ in the predefined serif font. (Defaults to Computer Modern Roman.) [\&4.5]
$\backslash$ textsc $\{\langle$ text $\rangle\}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Renders $\langle$ text $\rangle$ with the small-caps form of the current font family, if it exists. [§4.5]
$\backslash$ textsf\{$\{\langle$ text $\rangle\}$
Defined in: ETEX Kernel.

Renders $\langle$ text $\rangle$ in the predefined sans-serif font. (Defaults to Computer Modern Sans.) [§4.5]
$\backslash t e x t s l\{\langle$ text $\rangle\}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Renders $\langle$ text $\rangle$ with the slanted form of the current font family, if it exists. [84.5]
TM
Defined in: ATEX Kernel. $^{2}$
Trademark ${ }^{\text {TM }}$ symbol. [§4.3]
$\backslash t e x t t t\{\langle$ text $\rangle\}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Renders $\langle$ text $\rangle$ in the predefined monospaced font. (Defaults to Computer Modern Typewriter.) [§4.5]

Symbols
A $\quad \mathrm{N}$
B O
C $\quad \mathbf{P}$
D $\quad$ Q
E R
F S
G T
H U
I V

J W
K X
L
M
-
Defined in: ETEX Kernel. $^{\text {P }}$
Underscore _ symbol (see also
-). [§4.3]
$\backslash$ textup $\{\langle$ text $\rangle\}$
Defined in: $\mathrm{HT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Renders $\langle$ text $\rangle$ with the upright form of the current font family. [84.5]

 \textwidth

Defined in: ${ }^{E T} T_{E} X$ Kernel.
A length containing the width of the typeblock. Note that the actual contents of the line may fall short of the line width (underfull hbox) or extend beyond it (overfull hbox). This width does not include the area for marginal notes. [§2.17]
\thanks $\{\langle$ text $\rangle\}$
Defined in: Most classes that have the concept of a title page.
Inserts a special type of footnote in one of the titling fields, such as \author or \title. Usually used for some form of acknowledgement or affiliation. [§5.1]
\the $\langle$ register〉
Defined in: ETEX Kernel. $^{2}$

Displays the value of the given register (such as a length register). Not to be confused with \the $\langle$ ctr〉 commands, such as \thefigure. [§2.17]
$\backslash$ begin\{thebibliography $\}\{\langle$ widest entry label $\rangle$ \}
Defined in: Most classes that define sectioning commands.

Bibliographic list. (See also $\backslash$ bibitem and \cite). [§5.6]
\thechapter
Defined in: ETEX Kernel.
Displays the current value of the chapter counter [§11.0]
$\backslash$ thefigure
Defined in: ATEX Kernel. $^{\text {P }}$
Displays the current value of the figure counter [ $\$ 11.0$ ]
\thefootnote
Defined in: ${ }^{A T} T_{E} X$ Kernel.
Displays the current value of the footnote counter [§11.0]
$\backslash$ thepage
Defined in: ATEX Kernel. $^{2}$

Displays the current value of the page counter [§11.0]
\thesection
Defined in: ATEX Kernel. $^{\text {E }}$
Displays the current value of the section counter [\$11.0]
$\backslash$ Theta
Defined in: ESE $_{E}$ Kernel (Math Mode).
Greek upper case theta $\Theta$. [§9.4]
$\backslash$ theta
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).

Greek lower case theta $\theta$. [§9.4]
\thickspace
Defined in: amsmath package.
Thick space. [§9.4]

Symbols
A $\quad \mathrm{N}$
B O
C $\quad \mathrm{P}$
D $\quad$ Q
ER
F S
GT
H U
IV
J W
K X
L Y
M

[^14]
oTU
Y
\thinspace
Defined in: ATEX Kernel. $^{2}$
Thin space. [§9.4]
\thispagestyle\{〈style〉\}
Defined in: ETEX Kernel.
Like \pagestyle but only affects the current page. [§5.7]
$\backslash$ times
Defined in: ETEX Kernel (Math Mode).
Operator $\times$ symbol. [§9.4]
\tiny
Defined in: Most document classes.
Switches to tiny sized text. [§4.5]
$\backslash$ title $\{\langle$ text $\rangle\}$
Defined in: Most classes that have the concept of a title page.

Specifies the document title. This command doesn't display any text so may be used in the preamble, but if it's not in the preamble it must be placed before \maketitle. [85.1]

\titlehead\{ $\langle$ text $\rangle$ \}

Defined in: scrartcl, scrreprt, scrbook classes.

Specifies the title header (typeset at the top of the title page). [§5.1]
\to
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Right arrow $\rightarrow$. [§9.4]
$\backslash$ today
Defined in: Most of the commonly-used classes.

Inserts into the output file the date when the $\mathrm{ETT}_{\mathrm{E}} \mathrm{X}$ application created it from the source code. [§4.1]
\toprule[ $\langle w d\rangle]$
Defined in: booktabs package.
Horizontal rule for the top of a tabular environment. [§4.6]
\triangleleft
Defined in: ETEX Kernel (Math Mode).

Binary operator $\triangleleft$ symbol. [§9.4]
\triangleright
Defined in: ETEX Kernel (Math Mode).
Binary operator $\triangleright$ symbol. [§9.4]
\ttdefault
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.

The name of the default typewriter family as used by \ttfamily. Defaults to cmtt (Computer Modern Typewriter). [§8.2]
\ttfamily
Defined in: ATEX Kernel. $^{2}$
Switches to the predefined monospaced font. (Defaults to Computer Modern Typewriter.) [84.5]
$\backslash u\{\langle c\rangle\}$

Symbols
A $\quad \mathrm{N}$
B O
C $\quad \mathrm{P}$
D $\quad$ Q
E R
F S
G T
H U
I V
J W
K X
L
M

Defined in: ETTEX Kernel. $^{2}$
Breve diacritic over $\langle c\rangle$. Example:
$\backslash u\{0\}$ produces ǒ. [§4.3]
\underleftarrow\{〈maths〉\}
Defined in: amsmath package (Math Mode).

Puts an extendible left arrow under $\langle$ maths $\rangle$［§9．4］
\underleftrightarrow\｛〈maths〉\}
Defined in：amsmath package （Math Mode）．
Puts an extendible left－right arrow under $\langle$ maths $\rangle$［§9．4］
\underrightarrow\｛〈maths〉\}
Defined in：amsmath package （Math Mode）．

Puts an extendible right arrow under $\langle m a t h s\rangle$［§9．4］

 \Uparrow

Defined in： LTEX Kernel $^{(M a t h}$ Mode）．
Double－lined up arrow $\uparrow$ ．（May be used as a delimiter．）［§9．4］
\uparrow
Defined in： LATEX Kernel $^{\text {（Math }}$ Mode）．
Up arrow $\uparrow$ ．（May be used as a delimiter．）［§9．4］
\Updownarrow
Defined in：EATEX Kernel（Math Mode）．
Double－ended double－lined vertical arrow $\mathfrak{l}$ ．（May be used as a delimiter．）［§9．4］
\updownarrow
Defined in： ETE $_{E} X$ Kernel（Math Mode）．
Double－ended vertical arrow $\uparrow$ ． （May be used as a delimiter．）［§9．4］
\uplus
Defined in：LATEX Kernel（Math Mode）．

Operator (\uplus\)symbol．［§9．4］\upshapeDefinedin：ETEXKernel．Switchestotheuprightformofthecurrentfontfamily．［§4．5］\UpsilonDefinedin：$\mathrm{EAT}_{\mathrm{E}}\mathrm{X}$Kernel（MathMode）．GreekuppercaseupsilonY．［§9．4］\upsilonDefinedin：ETEXKernel（Math$^{\text{P}}$Mode）．Greeklowercaseupsilon$v$．［§9．4］\url\｛〈address〉\}Definedin：urlpackage．TypesetsanURLinatypewriterfontandallowsyoutousecharacterssuchas～．［84．5］\usepackage［〈option－list$\rangle$］\｛〈package－list$\rangle\}$Definedin：$\mathrm{EAT}_{\mathrm{E}}\mathrm{X}$Kernel．Loadsthenamedpackages．［§4．2］V$\backslashv\{\langlec\rangle\}$Definedin：$\mathrm{AT}_{\mathrm{E}}\mathrm{X}$Kernel．Carondiacriticover$\langlec\rangle$．Example：$\backslash\mathrm{v}\{\mathrm{o}\mathrm{\}}$producesǒ．［§4．3］\value\｛〈counter〉\}Definedin：$\mathrm{AT}_{\mathrm{E}}\mathrm{X}$Kernel．Referencesthevalueofthegivencounterwhereanumberratherthanacounternameisrequired．［§11．0］\varepsilonDefinedin：LTEXKKernel（$^{\text{Math}}$Mode）．undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

Variant Greek lower case alpha $\varepsilon$. [§9.4]
\varinjlim
Defined in: amsmath (Math Mode).
Typesets lim function name (may
have limits via _ or ^). [§9.4]
\varliminf
Defined in: amsmath (Math Mode).
Typesets lim function name (may have limits via _ or ${ }^{\wedge}$ ). [§9.4]
\varlimsup
Defined in: amsmath (Math Mode).
Typesets $\overline{\mathrm{lim}}$ function name (may have limits via _ or ^). [§9.4]
\varphi
Defined in: EATEX Kernel (Math $^{\text {P }}$ Mode).

| Variant Greek lower case phi $\varphi$. | Symbols |
| :---: | :---: |
| [§9.4] | A N |
|  | B O |
| \varpi | C |
| Defined in: ETEX Kernel (Math | D Q |
| Mode). | E R |
| Variant Greek lower case pi $\omega$. | F $\quad$ S |
| [§9.4] | H U |
| ojl | V |
|  | J W |
| Defined in: amsmath (Math Mode). | K X |
| Typesets lim function name (may | $\begin{array}{ll}\text { L } & \text { Y } \\ M & \end{array}$ |
| have limits via _ or ^). [§9.4] | M Z |

$\backslash$ varrho
Defined in: ETEX Kernel (Math Mode).
Variant Greek lower case rho $\varrho$. [§9.4]
$\backslash$ varsigma
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Variant Greek lower case sigma $\varsigma$. [§9.4]
\vartheta
Defined in: EATEX Kernel (Math $^{\text {P }}$ Mode).
A variant Greek lower case theta ข. [§9.4]
\vdash
Defined in: ETEX Kernel $^{2}$ (Math Mode).
Relational $\vdash$ symbol. [§9.4]
\vdots
Defined in: LATEX Kernel (Math $^{\text {E }}$ Mode).

Vertical ellipses : symbol. [§9.4]
$\backslash \mathrm{vec}\{\langle\mathrm{c}\rangle\}$
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Typesets its argument as a vector (defaults to a right arrow accent). [§9.4]
\vee
Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ Kernel (Math Mode).
Operator $\vee$ symbol. [§9.4]
\begin\{Vmatrix\} }
Defined in: amsmath package (Math Mode).
Like the array environment, but doesn't have an argument and adds double vertical bar delimiters. [§9.4]
\begin\{vmatrix\} }
Defined in: amsmath package (Math Mode).
Like the array environment, but doesn't have an argument and adds single vertical bar delimiters. [§9.4]
$\backslash \mathrm{vref}\{\langle$ string $\rangle\}$
Defined in: varioref package.
Like \ref but also adds information about the location, such as "on page $\langle n\rangle$ " or "on the following page". [§5.5]
$\backslash$ vspace $\{\langle$ length $\rangle\}$
Defined in: $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ Kernel.
Inserts a vertical gap of the given height. [§11.0]

| W | Symbols |
| :---: | :---: |
| \wedge | A N |
| \wedge | B O |
| Defined in: ETEX Kernel (Math | C P |
| Mode). | D Q |
| Operator $\wedge$ symbol. [§9.4] | E R |
|  | F S |
| \wr | G T |
| Defined in: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ K Kernel (Math | H U |
| Mode). | V |
|  | J W |
| Operator 2 symbol. [§9.4] | K X |
| X | L Y |
| \Xi | M Z |
| Defined in: ${ }^{\text {ATEX K K }}$ Kernel (Math Mode). |  |
| Greek upper case xi $\Xi$. [§9.4] |  |
| \xi |  |
| Defined in: ${ }^{\mathrm{AT}} \mathrm{EX}$ Kernel (Math Mode). |  |

Greek lower case xi $\xi$ ．［§9．4］ Greek lower case zeta $\zeta$ ．［§9．4］
\xleftarrow［〈subscript $\rangle$ ］ \｛〈superscript〉\}
Defined in：amsmath package （Math Mode）．
An extendible left arrow with a superscript and optionally a subscript．［§9．4］
\xrightarrow［〈subscript $\rangle$ ］ \｛〈superscript〉\}
Defined in：amsmath package （Math Mode）．

Symbols
A $\quad \mathrm{N}$

B O
C $\quad$ P
D Q
E R
F S
G T
H U
I V

J W
K X
L Y
M Z

An extendible right arrow with a superscript and optionally a subscript．［§9．4］

 Z

\zeta
Defined in：ETEX Kernel（Math
Mode）．

 GNU Free Documentation License

Version 1.2, November 2002<br>Copyright © 2000,2001,2002 Free Software Foundation, Inc.<br>51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

 Preamble

The purpose of this License is to make a manual, textbook, or other functional and useful document "free" in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondarily, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

 1. APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royaltyfree license, unlimited in duration, to use that work under the conditions stated herein. The "Document", below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as "you". You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

A "Modified Version" of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A "Secondary Section" is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (Thus, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.

The "Cover Texts" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

A "Transparent" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not "Transparent" is called "Opaque".

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML, PostScript or PDF designed for human modification. Examples of transparent image formats include PNG, XCF and JPG. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML, PostScript or PDF produced by some word processors for output purposes only.

The "Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

A section "Entitled XYZ" means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as "Acknowledgements", "Dedications", "Endorsements", or "History".) To "Preserve the Title" of such a section when you modify the Document means that it remains a section "Entitled XYZ" according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

 2. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

 3. COPYING IN QUANTITY

If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as
they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer-network location from which the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

 4. MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:
A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.
B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.
C. State on the Title page the name of the publisher of the Modified Version, as the publisher.
D. Preserve all the copyright notices of the Document.
E. Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.
F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.
G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.
H. Include an unaltered copy of this License.
I. Preserve the section Entitled "History", Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.
J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions
it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.
K. For any section Entitled "Acknowledgements" or "Dedications", Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.
L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.
M. Delete any section Entitled "Endorsements". Such a section may not be included in the Modified Version.
N. Do not retitle any existing section to be Entitled "Endorsements" or to conflict in title with any Invariant Section.
O. Preserve any Warranty Disclaimers.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied
from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section Entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties-for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of FrontCover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

 5. COMBINING DOCUMENTS

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections Entitled "History" in the various original documents, forming one section Entitled "History"; likewise combine any sections Entitled "Acknowledgements", and any sections Entitled "Dedications". You must delete all sections Entitled "Endorsements".

 6. COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

 7. AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an "aggregate" if the copyright resulting from the compilation is not used to limit the legal rights of the compilation's users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document's Cover Texts may be placed on covers that
bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

 8. TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

If a section in the Document is Entitled "Acknowledgements", "Dedications", or "History", the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

 9. TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt to copy, modify, sublicense or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

 10. FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See http://www.gnu.org/copyleft/.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License "or any later version" applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.

 ADDENDUM: How to use this License for your

 documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

Copyright © YEAR YOUR NAME. Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.2 or any later version published by the Free Software Foundation; with no Invariant Sections, no Front-Cover Texts, and no Back-Cover Texts. A copy of the license is included in the section entitled "GNU Free Documentation License".

If you have Invariant Sections, Front-Cover Texts and Back-Cover Texts, replace the "with ... Texts." line with this:
with the Invariant Sections being LIST THEIR TITLES, with the Front-Cover Texts being LIST, and with the Back-Cover Texts being LIST.

GNU Free Documentation License

If you have Invariant Sections without Cover Texts, or some other combination of the three, merge those two alternatives to suit the situation.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.

 History

 25th Sept 2012 (Version 1.4)

1 Paperback edition 1 produced.
2 Added TeXWorks section.
3 Moved "Text editor and Terminal approach", "TeXnicCenter" and "WinEdt" sections to new supplementary material.
4 Added hardcopy-related code.
5 Change to KOMA-Script classes (both for examples and for pdf versions of this document).
6 Changed from using subfloat to subcaption package.
7 Added section on inter-sentence spacing.
8 Moved "Errors" and "Where to get Help?" to appendices.
9 Moved section "Downloading and Installing Packages" to new appendix chapter.
10 Moved introduction to packages to "Creating a Simple Document".
11 Moved datetime section to "Creating a Simple Document" chapter. (Removed reference to ukdate package.)
12 Moved babel section to "Structuring Your Document" chapter.
13 Moved graphicx section to its own chapter.
14 Added section on align.
15 Added \cfrac, \substack and amsmath ellipses to maths chapter.
16 Added extensible arrows and $\backslash$ bigl etc to maths chapter.
17 Added booktabs.
18 Moved lengths chapter to section in definitions.
19 Added summary chapter with commands hyperlinked to their definitions in the summary.
20 Changed definitions chapter to use a glossary structure.
21 Moved bibliography into bib file.
22 Added varioref.
23 Removed dependency on html package (for pdf versions) to avoid conflict between html and varioref (html package functions not defined by hyperref now emulated; comment package loaded to provide htmlonly environment).
24 Removed image of equation written in Word (Microsoft have improved their equation rendering) and added link to Murray Sargent III blog [12].
25 Added section on what a terminal/command prompt is.
26 Added section on auxiliary files.
27 Added section on Perl.
28 Added information about latexmk
29 Mentioned grffile package.
30 Mentioned on-the-fly EPS conversion.
31 Mentioned etoolbox's \appto and babel's \addto.
32 Changed to UTF-8 and mostly changed to using code points instead of named entities in HTML files.
33 Moved the document's home page from http://theoval.cmp.uea. ac.uk/~nlct/latex/novices/ to http://www.dickimaw-books.com/ latex/novices/.

 15th Jan 2008 (Version 1.3)

The main reason behind this change was to increase accessibility and conform to W3C guidelines. If you are experiencing problems relating to accessibility, please let me know (clearly stating the problem).
34 Corrected error in the university's post code on the title page
35 Added alternative text tags to more of the images, and made some of the images hyperlinks to a more detailed description of the image.
36 Added information on how to break ligatures.
37 Moved information on TeX to the introduction, and removed section on TeX that was in the "Some Definitions" chapter.
38 Document nodes now have permanent names instead of the generic node $\langle n\rangle . h t m l$ which EATEX2HTML generates by default. $^{\text {E }}$
39 Went back to using straight double quotes in the HTML document as the fancy typographic double quotes are nonstandard.

 8th May 2007 (Version 1.2)

40 Links to UK FAQ [18] added.
41 Overview made into a separate section, and tidied up a bit.
42 Added some extra definitions: moving arguments and fragile commands, robust commands, short and long commands.
43 Changed "Text editor and Terminal approach" to deal with Unixtype systems rather than MS-DOS.
44 Moved section on tabular environment.
45 Added section on boxes and mini-pages.
46 Segmented section on font changing commands.
47 Segmented section describing graphicx.
48 Added section on the babel package.
49 Updated and segmented section on downloading and installing new packages.
50 Added section on side-by-side figures.
51 Updated section on sub-figures to use the new subfloat package instead of the obsolete subfigure package.
52 Added "Need More Help?" chapter.

 Back Cover Text

(See http://www.gnu.org/licenses/fdl-howto-opt.html\#SEC2.)
If you choose to buy a copy of this book, Dickimaw Books asks for your support through buying the Dickimaw Books edition to help cover costs.

[^0]:    ${ }^{1.1}$ Sure, you could use a search and replace function, but a sweeping replace-all can have unexpected side effects. For example, your document may include the sentence, "Figures from the last quarter showed improvement", which would get changed to, "Figs from the last quarter showed improvement".
    ${ }^{1.2}$ Glossaries are covered in Using $L A T E X$ to Write a PhD Thesis [13].
    ${ }^{1.3}$ Automating bibliographies is covered in Using LATEX to Write a PhD Thesis [13].

[^1]:    ${ }^{1.4}$ Ligatures can be suppressed using the microtype package if necessary

[^2]:    ${ }^{1.5}$ The source code is available at http://www. dickimaw-books.com/latex/novices/, but it really is
    not the place to start if you are a beginner, as it contains LATEX and Perl code beyond the scope
    ${ }^{1.5}$ The source code is available at http://www. dickimaw-books. com/latex/novices/, but it really is
    not the place to start if you are a beginner, as it contains $\operatorname{LAT} \mathrm{X}$ and Perl code beyond the scope of this tutorial.
