# Acknowledgements

I would like to thank my supervisor, Professor Someone. This research was funded by the Imaginary Research Council.

# Abstract

A brief summary of the project goes here.

# 1 Introduction

First of all, let's cite a book [4] now let's cite a journal paper and a conference proceedings [1, 3]. Finally, let's cite a chapter in a book [2, Chapter 9].

## 2 Technical Introduction

### 2.1 Listings

Some sample code is shown in Listing 2.1.

Listing 2.1: Sample

```
#include <stdio.h> /* needed for printf */
#include <math.h> /* needed for sqrt */

int main()
{
    double x = sqrt(2.0); /*  $x = \sqrt{2}$  */

    printf("x = %f\n", x);

    return 1;
}
```

### 2.2 Theorems

**Definition 1 (Tautology)** A *tautology* is a proposition that is always true for any value of its variables.

**Definition 2 (Contradiction)** A *contradiction* is a proposition that is always false for any value of its variables.

**Theorem 1** *If proposition  $P$  is a tautology then  $\sim P$  is a contradiction, and conversely.*

**Example 1** “It is raining or it is not raining” is a tautology, but “it is not raining and it is raining” is a contradiction.

**Remark 1** Example 1 used De Morgan’s Law  $\sim (p \vee q) \equiv \sim p \wedge \sim q$ .

## 2.3 Algorithms

Using algorithm (theorem-like) and tabbing environments:

### Algorithm 1 (Gauss-Seidel Algorithm)

1. For  $k = 1$  to maximum number of iterations

2. For  $i = 1$  to  $n$

$$\text{Set } x_i^{(k)} = \frac{b_i - \sum_{j=1}^{i-1} a_{ij}x_j^{(k)} - \sum_{j=i+1}^n a_{ij}x_j^{(k-1)}}{a_{ii}}$$

3. If  $|\vec{x}^{(k)} - \vec{x}^{(k-1)}| < \epsilon$ , where  $\epsilon$  is a specified stopping criteria, stop.

Using floating algorithm2e environment:

```

for  $k \leftarrow 1$  to maximum iterations do
  | for  $i \leftarrow 1$  to  $n$  do
  | |  $x_i^{(k)} = \frac{b_i - \sum_{j=1}^{i-1} a_{ij}x_j^{(k)} - \sum_{j=i+1}^n a_{ij}x_j^{(k-1)}}{a_{ii}};$ 
  | end
  | if  $|\vec{x}^{(k)} - \vec{x}^{(k-1)}| < \epsilon$  then
  | | Stop
  | end
end

```

**Algorithm 2:** Gauss-Seidel Algorithm

## 3 Method

The distance was measured in km and the area in km<sup>2</sup>. The acceleration was given in m s<sup>-2</sup>.

## 4 Results

Out of 12 890 experiments, 1289 of them had a mean squared error of 0.346 and 128 of them had a mean squared error of  $1.23 \times 10^{-6}$ .

The acceleration was approximately  $9.78 \text{ m s}^{-2}$ .

## 5 Conclusions
