

This example has  
an elliptical shape. The  
parameters were constructed  
from the definition of the path,  
not the outline defined by the line  
style of the path. The paragraph in-  
dentation was suppressed at the start  
using `\noindent` to help keep the  
desired shape. Again it needs to have  
just the right amount of text to fill  
the entire shape, unlike paragraphs  
created using `\shapepar` (de-  
fined in `shapepar.sty`) which  
expand or shrink to  
fit the shape.
